1. Introduction

1.1. About the Project

The European Holocaust Research Infrastructure (EHRI) is a transnational organisation with partners all across Europe, Israel and the US. They promote collaboration on Holocaust research and easy access to scattered sources. To this end, they created the EHRI Online Editions, which are collections of archival documents on the Holocaust, gathered around a more specific theme.

1.2. About this Document

This document is intended as a means for the homogenisation of encoding practices of the EHRI Online Editions. Editors may indeed vary from one edition to another, and it is essential that the encoding practices are coherent and homogenous throughout the editions.

These encoding guidelines are not a replacement for the original TEI Guidelines, but rather a way to clarify some uses in the context of the EHRI Online Editions, which include many types of documents.

2. Encoding Guidelines

XML is a very rich markup language, and the TEI standard provides an extremely large set of elements that can be used to encode textual documents. However, the TEI must be adapted based on the type of document encoded since correspondence, reports and newspaper articles are structurally different, and therefore do not require the same encoding elements.

2.1. Ground Rules

2.1.1. File Identifier

The file's identifier only appears once in the \leq teiHeader \geq as the value of the xml:id attribute in the \leq TEI \geq root element. The syntactical structure of the identifier is "EHRI-{collection_id}-{date_source}_{language_id}".

xml:id="EHRI-BF-19380120_DE"

2.1.2. English as the main encoding language

English should be the main language for metadata encoding in EHRI files as it is a universal language for editors and researchers. In order to facilitate the understanding of the files, whenever it is possible, there should be a proposed English translation for information appearing in their original language, like titles for instance (signaled by an *xml:lang* attribute with the en value):

```
<title xml:lang="en">Richard A. Bermann on his filed escape to
Czechoslovakia</title>
<title xml:lang="de">Richard A. Bermann über seine gescheiterte Flucht
in die Tschechoslowakei</title>
```

The keywords associated with the file should be in English (rather than any other language), in lower case and in their singular form:

```
<keywords>
  <term>government document</term>
  </keywords>
```

Similarly, attribute values must be in English only, for better understanding.

<catRef target="expulsion_policy"/>

2.1.3. Format of date and language attribute values

THe format for date and language attributes is predefined:

• When the date is available in the YYYY-MM-DD format, use when-iso. In any other case, use when.

```
<date when-iso="1939-09-01">September 1, 1939</date>
<date when="1940-06">June 1940</date>
<date when="1945">1945</date></date when="1945">1945</date>
```

xml:lang

Iana Language Subtag Registry

- Czech: csDutch: nlEnglish: enFrench: fr
- German: deHebrew: he
- Hungarian: huItalian: it
- Polish: pl

- Russian: ru Slovak: sk Ukrainian: uk
- Yiddish: yi

2.2. The TEI Header (<teiHeader>)

The <teiHeader> contains the document's metadata. It is divided into four main sections:

- <fileDesc> (description of the electronic file)
- <encodingDesc> (context of the encoding)
- cprofileDesc> (description of non-bibliographic aspects of the text)
- <revisionDesc> (revision history of the file)

2.2.1. File Description (<fileDesc>)

The <fileDesc> is composed of:

- titleStmt (title statement) groups information about the title of a work and those responsible for its content.
- publicationStmt (publication statement) groups information concerning the publication or distribution of an electronic or other text.
- **seriesStmt** (series statement) groups information about the series, if any, to which a publication belongs.
- sourceDesc (source description) describes the source(s) from which an electronic text was derived or generated, typically a bibliographic description in the case of a digitized text, or a phrase such as "born digital" for a text which has no previous existence.

2.2.1.1. Title Statement (<titleStmt>)

The <titleStmt> is a mandatory element of the <teiHeader>. It delivers information about the document's title, author(s), and/or editor(s).

2.2.1.1.1. Title (<title>)

The <u><title></u> of the document should at least be given in English. It should also appear in the original language, whenever possible.

```
<title xml:lang="en">Excerpt from an interview with Leopold
 Sonnenfeld about his deportation to Nisko</title>
<title xml:lang="de">Auszug aus einem Interview mit Leopold
Sonnenfeld über seine Deportation nach Nisko</title>
```

2.2.1.1.2. Principal Researcher (<principal>)

The sprincipal element contains the <affiliation</pre> element. This embedding of elements aims at naming the institution responsible for the electronic file, which in this case is the European Holocaust Research Infrastructure (given in an <orgName> element).

```
cipal>
 -
<affiliation>
 <orgName>European Holocaust Research
    Infrastructure</orgName>
</affiliation>
```

2.2.1.1.3. Statement of Responsibility (<respStmt>)

The <respStmt> designates the person(s) responsible for the edition of a particular file. They are identified by an element such as spersName or corgName, depending on their status. The resp element describes their role in the file processing from digitization to publication.

List of suggested values for <<u>resp></u>:

- "Digitized by"
- "Transcribed by"
- · "Encoded by"

```
<respStmt>
 <resp>Encoded by</resp>
 <persName>Wolfgang Schellenbacher</persName>
```

If details of the process are unknown, it is possible to use the mention "Edited by", but it must not be the privileged

2.2.1.2. Publication Statement (<publicationStmt>)

The spublicationStmt> gives information on the publication of the electronic file, and should therefore not be confused with the source description (<sourceDesc>) which holds details on the source document prior to its digitization.

It contains two elements:

• <u><authority></u> contains a <u><ref></u> element whose value is "European Holocaust Research Infrastructure", with a target attribute pointing to the EHRI website.

• <a vailability > contains a element and specifies the conditions of distribution and use of the file or project. As the goal of EHRI is the widespread and free disposal of Holocaust sources, the common license used is the Creative Commons Attribution-ShareAlike 4.0 International.

The Creative Commons licenses have varying degrees of restrictions on modification and reuse, which the editors can choose from.

2.2.1.3. Series Statement (<seriesStmt>)

The <u><seriesStmt></u> holds the name of the digital edition in a <u><title></u> element, which has a *ref* attribute with a link to the online edition.

The name of the edition should appear in English.

```
<seriesStmt>
<title ref="https://nisko-transports.ehri-project.eu/">From
    Vienna to Nowhere: the Nisko Deportations in 1939</title>

<p
```

2.2.1.4. Source Description (<sourceDesc>)

2.2.1.4.1. Manuscript Description (<msDesc>)

The <msDesc> was originally created to facilitate the encoding of manuscripts, but this set of elements can also be used to encode printed texts. The documents selected for the EHRI Online Editions all come from various institutions with their own collections and identifiers, thus it is relevant to include a manuscript description in the metadata to distinguish the holding institution from the publishing institution.

The <msDesc> contains:

- msIdentifier (manuscript identifier) contains the information required to identify the manuscript or similar object being described.
- <u>physDesc</u> (physical description) contains a full physical description of a manuscript, manuscript part, or other object optionally subdivided using more specialized elements from the model.physDescPart class.

2.2.1.4.1.1. Manuscript Identifier (<msIdentifier>)

The gives information on the source document and its holding institution:

- The <institution> element contains its name and address.
- The <<u>collection</u>> element specifies the name of the document's collection in the catalogue.
- The <idno> designates the document's identifier in their catalogue.

The element may be used instead of, or following, the <a href="repo

2.2.1.4.1.2. Physical Description (<physDesc>)

The physical description of the source document is optional. If the document is peculiar or has specificities, we might encode the \leq physDesc \geq with a \leq p \geq element.

```
cyphysDesc>
Red annotations in the margins.
</physDesc>
```

2.2.1.4.2. Bibliographic Citation (<bibl>)

The

sibl> element provides a bibliographic description of the source document. It usually contains the name of the holding institution, the name of the collection, and the source document's identifier. The only mandatory component is textLang> with the mention "Original in {language}", and a mainLang attribute. The values for both attributes must match the Iana Language Subtag Registry.

```
<bibl>Hungarian Jewish Archives, DEGOB, Protocol no. 651.
<textLang mainLang="hu">Original in
    Hungarian.</textLang>
</bibl>
```

2.2.2. Encoding Description (<encodingDesc>)

The <encodingDesc> contains the project description (cprojectDesc>) in a element, with an xml:lang attribute.

2.2.3.1. Creation (<creation>)

The <creation> element provides information on the source document's creation. It can contain several sub-elements depending on the availability of information:

- <o in square date of creation, written in a "Day Month Year" format (e.g. "16 August 1941"), with a when or when-iso attribute.
- <origPlace>: names of the city and country, with a ref attribute with a link to the place's GeoNames webpage.

```
<creation>
  <origDate when-iso="1943-05-28">28 May 1943</origDate>
  <origPlace ref="https://www.geonames.org/683506/bucharest.html">Bucharest, Romania</origPlace>
  Name ref="#ehri_dr_biering_erik_andreas_mathias">Erik
    Andreas Mathias Biering
</creation>
```

2.2.3.2. Text Classification (<textClass>)

The <textClass> element provides information on the content of the document. It contains an empty <catRef> element, with a *target* attribute refering to the text's typology. The category reference is followed by the <keywords> element, in which every keyword is specified with a <term> element.

```
<textClass>
<catRef target="history/austria_until_1938"/>
<keywords>
<term>state document</term>
</keywords>
</textClass>
```

2.2.3.3. Language Usage (<language>)

The <<u>langUsage></u> element references all the languages appearing in the source document. For instance, in a document written in German with a few Yiddish terms, both languages will be referenced in a <u><language></u> element completed by an *ident* attribute.

```
<langUsage>
<language ident="de">German</language>
<language ident="yi">Yiddish</language>
</langUsage>
</language ident="yi">Yiddish</language>
</language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language></language>
```

2.2.3.4. Abstract (<abstract>)

The <abstract> provides a brief summary of the source document's content in a paragraph () in English.

```
op xml:lang="en">Testimony of 16-year-old K. H. on the deportation
of his family to Kamenets-Podolsk in the summer of 1941, hiding
in K#rösmez#/Yasina, finding shelter in a Jewish orphans' home
in Budapest, his arrest and deportation to Auschwitz, his
experiences in Buchenwald, the IG Farben (Brabag) synthetic fuel
factory in Rehmsdorf, and his liberation in Theresienstadt.
```

2.2.4. Revision Description (<revisionDesc>)

The <a

- when: date of revision.
- who: person responsible for the revision. The syntax for the value of who is: "#forename.surname".

```
<revisionDesc>
<change when="2021-11-05"
  who="#floriane.chiffoleau">Upgrading TEI
  encoding</change>
  <change when="2020" who="#ehri">Encoding of the file</change>
</revisionDesc>
```

2.3. The Body (<body>)

2.3.1. Structuring the transcription

2.3.1.1. Basic text structure

The \leq body \geq of the TEI file is composed of nested \leq div \geq elements, which take a mandatory *type* attribute. The value of *type* depends on the structure of the document, but for the first-level \leq div \geq the value is either "transcription" or "translation."

```
<div type="transcription">
An das Bezirksgendarmerie Kommando, alle Gend. Posten
```

```
Kommandos und die Grenzkontrollstelle in Berg.
```

Within the first-level division, the sections are also divided within \leq elements, which can be numbered with the *n* attribute. If the sections are titled, the title should appear in a \leq element:

```
<div type="transcription" xml:lang="de"</pre>
 <pb n="1" facs="EHRI-NISKO-193910a_01.jpg"/>
 <head>Betrifft: Umschichtung von Juden - Durchführung der
   Transporte.</head>
 <div n="1'
  <head>I. Vorbereitungen:</head>
   <lb/>Die genaue namentliche Erfassung der mittellosen
     Juden deut<lb break="no"/>scher, polnischer und tschechischer Staatsangehörigkeit, so<lb break="no"/>wie
     staatenloser Juden, ist rechtzeitig durchzuführen.
 </div>
 <div n="2">
  <head>II. Ausmusterung:</head>
   clb/>Die für den Transport von den jüd. Gemeinden
     eingeteilten Ju<lb break="no"/>den sind
     zweckmäßigerweise vor Abgang des Zuges in geeigne<lb break="no"/>ten, in der Nähe des Bahnhofs gelegenen,
Sälen zu konzen<lb break="no"/>trieren. Die Juden haben
     mit ihrem Gepäck zu erscheinen, da <lb/>hoach der
     Ausmusterung sofort mit der Einwaggonierung begonnen
  <lb/>wird.
  [...]
 </div>
```

The paragraphs are naturally encoded with the $\leq p \geq$ element.

2.3.1.2. Reproducing the structure of the facsimile

2.3.1.2.1. Layout

- **<u>pb</u>** (page beginning) marks the beginning of a new page in a paginated document.
- **lb** (line beginning) marks the beginning of a new (typographic) line in some edition or version of a text.
- space (space) indicates the location of a significant space in the text.
- metamark contains or describes any kind of graphic or written signal within a document the function of which is to determine how it should be read rather than forming part of the actual content of the document.

2.3.1.2.1.1. Page beginning (<pb>)

The $\leq pb \geq$ element is an empty element which marks the beginning of a new page, corresponding to the image of the facsimile. It appears at the start of the transcribed page, and takes the *facs* attribute, the value of which is the corresponding image file of the page. All $\leq pb \geq$ are numbered with the *n* attribute.

```
<pb n="2" facs="EHRI-NISKO-193910a_02.jpg"/>
```

2.3.1.2.1.2. *Line beginning* (<1b>)

The <<u>lb></u> element is an empty element that marks the beginning of a new typographic line.

For the transcription to be as close as possible to the layout of the source document, the $\leq lb \geq$ element can appear in the middle of words, in which case it takes the *break* attribute with the value "no" to signal that even though it is physically the end of the line, it is not the end of the semantic bloc.

```
<1b/>Die für den Transport von den jüd. Gemeinden
eingeteilten Ju<1b break="no"/>den sind
zweckmäßigerweise vor Abgang des Zuges in geeigne<1b break="no"/>ten, in der Nähe des Bahnhofs gelegenen,
Sälen zu konzen<1b break="no"/>trieren. Die Juden haben
mit ihrem Gepäck zu erscheinen, da <1b/>nach der
Ausmusterung sofort mit der Einwaggonierung begonnen
<1b/>wird.
```

2.3.1.2.1.3. Space (<space>)

If there is a significant space in the text, it should be signaled with the <space> element. The dim attribute indicates whether the space is horizontal or vertical. The description of the physical space is done with the help of the quantity and unit attributes.

```
<space dim="horizontal" quantity="10"
unit="mm"/>
```

2.3.1.2.1.4. Elements of visual division (<metamark>)

Whenever there is a division within the text marked with anything other than significant spacing, it is recommended to use the empty <metamark> element. It takes two mandatory attributes: function and style:

- The value of the function attribute is always "division."
- The style attribute describes the visual division. Suggested values include: "crosses," "line," "stars" and "dots."
- If there is a name for the type of division used, it appears in a *type* attribute.

```
<metamark function="division" style="stars"
type="dinkus"/>
```

2.3.1.2.2. Lists (<list>)

Lists should be encoded with a <u><list></u> element, within which there are <u><item></u> elements. As the <u><item></u> element displays bullet points, if the items are numbered in the document, they should be encoded with the <u><label></u> element.

2.3.1.2.3. Tables ()

Tables are encoded with the \leq table \geq element, which contains several \leq row \geq elements. The number of columns is defined by the number of \leq tell \geq elements within \leq row \geq .

Structure:

- Rows are presented from top to bottom.
- Columns are presented left to right within each row.

For better understanding, it is possible to indicate the number of rows and columns with the *rows* and *cols* attibutes in the tag.

```
<row>
 <cell>Name</cell>
 <cell>Geburtsort</cell>
 <cell>Schuleberuf</cell>
 <cell>Wohnort</cell>
 <cell>Familienstand</cell>
</row>
<row>
 <cell>
  <persName ref="#ehri et rubinstvn marta"</pre>
   <surname>Rubinstvn</surname>
   <forename>Marta</forename>
  </persName>
 <cell>
  1906
  15/IX <placeName ref="#belzyce" type="ehri">#######</placeName>
 <cell>#########</cell>
  <placeName ref="#munich" type="ehri">- ###
######
            </placeName>
 </cell>
 <cell>########</cell>
```

2.3.1.3. Further division: openers and closers

Some documents like letters or reports can be described in more details than with simple divisions, with an opener and/or a closer. The elements possibly contained in either opener or closer include:

- address (address) contains a postal address, for example of a publisher, an organization, or an individual.
- addrLine (address line) contains one line of a postal address.
- <u>byline</u> (byline) contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.
- <u>dateline</u> (dateline) contains a brief description of the place, date, time, etc. of production of a letter, newspaper story, or other work, prefixed or suffixed to it as a kind of heading or trailer.
- <u>salute</u> (salutation) contains a salutation or greeting prefixed to a foreword, dedicatory epistle, or other division of a text, or the salutation in the closing of a letter, preface, etc.
- <u>signed</u> (signature) contains the closing salutation, etc., appended to a foreword, dedicatory epistle, or other division of a text.

```
<opener>
<br/>
<br/>
dateline>
<adateline>
<adate
```

2.3.2. Displaying the text

2.3.2.1. Named entities (<persName>, <placeName> or <orgName>) and references (<rs>)

Named entities are encoded in two ways. If a person, place or organization is referred to by its name, then they should be encoded with eprsName>, eplaceName> or <orgName> accordingly.

```
<persName>Franciszek Stoch</persName>
<persName>Deputy Stoch</persName>
```

However, if a names entity is mentioned without any proper name, then it should be encoded with <<u>rs></u>. The reference string element contains a reference to a named entity which is not named by its full name, and takes the text's context into account. It takes two mandatory attributes:

- type: "org", "person" or "place".
- ref: reference to the xml:id in the index.

```
<rs type="person"
ref="ehri_et_stoch_franciszek">the deputy</rs>
```

2.3.2.2. Foreign languages (<foreign>)

Words, expressions and text passages in a language other than the document's main language are encoded with the <<u>foreign></u> element. It takes a mandatory *xml:lang* attribute, which comes with a semi-closed list of values containing the languages used, at least once or that could potentially be used, by the EHRI editions.

```
Tábor #ítal asi 1800 muž#, v#tšinou ma#arských
Žid#, a kdo neum#l ma#arsky, byl skoro ztracen. Bydlili jsme
v t. zv. <foreign xml:lang="de">Erdbunker</foreign> - dlouhé,
podzemní baráky s jedním oknem, dv# #ady prken na spaní,
uprost#ed komín a kamínka. Každý v#ze# m#l deku, misku a
lžíci.
```

2.3.2.3. Highlighted text (<hi>>)

When a part of the text is graphically distinct from the rest of the text, it should be encoded with \leq hi \geq .

```
<hi rend="italic">G. E. R. Gedye, Die Bastionen fielen. Wie der
Faschismus Wien und Prag überrannte.</hi>
```

2.3.2.4. Unclear parts of the text (<unclear>) and deletions ()

Passages that are hard to read should be encoded accordingly. When the text is difficult to read for reasons dealing with the conservation of the document, <unclear> should be used with the reason attribute.

```
The Gestapo told us that they would take us to work at a good place. On <unclear reason="faded">our</unclear> arrival in Auschwitz they separated me from the rest of my family and I had no idea what was in store for me.
```

When a passage has been explicitly deleted from the text by someone, it should be encoded with \leq del \geq which takes the mandatory attribute *rend*.

```
Samstag den 14. Okt.
1939 um <del rend="strikethrough">10</del>, <del rend="strikethrough">10</del>, <del rend="strikethrough">16</del> Uhrim Kuppelsaale, 2., zuverlässig zu erscheinen.
```

3. Indices

There are four indices for the EHRI Online Editions, with one file for each index:

- Index of Organizations
- Index of Persons
- · Index of Places
- · Index of Terms

3.1. Index of Organizations

The index of organizations is contained in a \leq listOrg \geq element. Each organization appears within an \leq org \geq element with an xml:id. The name of the organization appears twice in \leq orgName \geq elements, distinguished by an xml:lang attribute. Thus, the name of the organization should first appear in English and then in its original language, depending on the availability of such information. The name of the organization is followed by a description (\leq desc \geq) in English, with a reference (ref) to the entity on the EHRI portal. The location of the organization is indicated with a \leq place \geq element and its xml:id. In the same way as the name of the organization, if the \leq placeName \geq is available in English and its original language, then there are two elements. The city where the organization is located is indicated with the \leq settlement \geq element and the type attribute with the value "city." If the organization has a VIAF (Virtual International Authority File), it is encoded in the \leq idno \geq element, specified by the type attribute with the value "VIAF."

```
</ir>

</fr>

<org xm1:id="ehri_cb-1269">

<place>

<country key="SK"/></place>

<
```

3.2. Index of Persons

The index of persons is contained in a !element. Every person appears within a !element element with an xml:id. The name of the person is encoded within a !element containing at least the !element containing at least the !element. The !element. The !element. The !element. The full date is unknown) and a !element. The full date is unknown) and a !element. The sex of the person is given by the !element. with the value attribute, which is either "M" for "Male," "F" for "Female," or "U" for "Unknown." The person's occupation appears in the !element. If the person has a VIAF (Virtual International Authority File) or GND (Gemeinsname Normdatei) identifier, it is encoded in the !element. It is encoded in the !element. The full date is unknown) and a !element. The person's occupation appears in the !element. It is encoded in the !element. It is encoded in the <a h

```
person
<person xml:id="ehri_pers-000462">
<personame>
   <forename>Karl</forename>
   <surname>Brandt</surname>
  </persName>
  <br/>dirth>
   <date when-iso="1904-01-08"/>
   <placeName>Mulhouse, Alsace-Lorraine, Germany</placeName>
  <death>
   <date when-iso="1948-06-02"/>
   <placeName>Landsberg Prison, Germany</placeName>
  </death>
 <occupation>physician</occupation>
<idno type="VIAF">8181132</idno>
   Personal physician of German dictator Adolf
       Hitler.
 </event>
</listPerson>
```

3.3. Index of Places

The index of places is contained in a \leq listPlace \geq element. The places appear within a \leq place \geq element, specified by two attributes: type (e.g. "camp," city," etc.) and xml:id. Just like in the indices of organizations and persons, the name of the place appears (whenever available) both in its original language and its English translation, in two separate \leq placeName \geq elements distinguished by the value of their xml:lang attribute. The geographical coordinates of the place are contained in the \leq geo \geq element, within a \leq location \geq element. The country is specified in the \leq country \geq element by the mandatory key attribute. There are two types of identifiers for places, contained in \leq idno \geq elements with a type attribute ("geonames" and "wikidata)." The \leq note \geq element contains a brief description of the place.

3.4. Index of Terms

The index of terms is contained in a \leq list \geq element. Each term is encoded with the \leq item \geq element and its xml:id. The \leq name \geq of the term should appear at least in its original language and in English. It can also appear in other

languages if the translation is available. The term is described thanks to the <desc> element. The link> element contains the link to the term's entry in the controlled vocabulary on the EHRI portal with the *target* attribute. If the term has a Wikidata page, its identifier should appear in an <idoes element with the *type* attribute, whose value is "wikidata."

5.1.2. <abbr>

<abbr>> (abbreviation</abbr>	n) contains an abbreviation	of any sort. [3.6.	5. Abbreviations and Their Expansions]
Module	core	core	
Attributes	(@rend, @style,	@rendition)) (at bility (@cert, @r	ang, @xml:base, @xml:space) (att.global.rendition t.global.facs (@facs)) (att.global.change (@change)) (at- resp)) (att.global.source (@source)) att.typed (type, @sub- the encoder to classify the abbreviation according to some pology. att.typed
		Status	Optional
		Datatype	teidata.enumerated
		Sample values include:	sus-pen-(suspension) the abbreviation provides the firstsion letter(s) of the word or phrase, omitting the remainder.

	Note	trac-(contraction) the abbreviation omits some lettion ter(s) in the middle. bre- vi- the abbreviation comprises a special symbol or graphark. su- per- (superscription) the abbreviation includes writing scripabove the line. tion acronym (acronym) the abbreviation comprises the initial letters of the words of a phrase. ti- tle (title) the abbreviation is for a title of address (Dr, Ms, Mr,) or- ga- (organization) the abbreviation is for the name of ni- an organization. za- tion ge- o- (geographic) the abbreviation is for a geographic graphame. ic The type attribute is provided for the sake of those who wish to classify abbreviations at their point of occurrence; this may be useful in some circumstances, though usually the same abbreviation will have the same type in all occurrences. As the sample values make clear, ab-
		breviations may be classified by the method used to construct them, the method of writing them, or the referent of the term abbreviated; the typology used is up to the encoder and should be carefully planned to meet the needs of the expected use. For a typology of Middle English abbreviations, see 6.2.

Member of	model.respLike
Contained by	header: titleStmt
May contain	core: abbr address date del distinct foreign hi lb name note num pb q ref rs term title unclear header: idno msdescription: origDate origPlace namesdates: affiliation country forename geo location nameLink orgName persName place-Name settlement surname transcr: metamark space character data
Note	Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes <i>key</i> or <i>ref</i> may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource. In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast. Where an author is unknown or unspecified, this element may contain text such as <i>Unknown</i> or <i>Anonymous</i> . When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.
Example	<pre><author>British Broadcasting Corporation</author> <author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634-1693)</author> <author>Anonymous</author> <author>Bill and Melinda Gates Foundation</author> <author></author></pre>
Content model	<content> <macroref key="macro.phraseSeq"></macroref> </content>
Schema Declaration	<pre>element author { att.global.attributes, att.naming.attributes, att.datable.attributes, macro.phraseSeq }</pre>

5.1.8. <authority>

<authority> (release authority) supplies the name of a person or other agency responsible for making a work available, other than a publisher or distributor. [2.2.4. Publication, Distribution, Licensing, etc.]

Note	This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <delspan> element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions. The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a <supplied> tag). Illegible or lost text within a deletion may be marked using the <gap> tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the <gap> element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the <u>unclear> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way. Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <certainty> element (see 21. Certainty, Precision, and Responsibility). There is a clear distinction in the TEI between and <surplus> on the one hand and <gap> or <unclear> on the other. indicates a deletion present in the source being transcribed, which states the author's or a later scribe's intent to cancel or remove text. <surplus> indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. <gap> or <unclear>, by contrast, signal an editor's or encoder's decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.</unclear></gap></surplus></unclear></gap></surplus></certainty></u></gap></gap></supplied></delspan>

Note	The global <i>xml:lang</i> attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in 6.1. Language Identification. This element is intended for use only where no other element is available to mark the phrase or words concerned. The global <i>xml:lang</i> attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

Note	The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div1> is the title of that chapter or section.</div1></head></head></head>	
Example	The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or incipits may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example: <divl n="I" type="book"></divl></trailer></head>	
Example	When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the <i>place</i> attribute. <pre></pre>	
Example	The <head> element is also used to mark headings of other units, such as lists: With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. tend <item>above</item> <item>accordingly <item>accordingly</item></item></head>

Note	May contain simple prose or a sequence of chunks. Whatever string of characters is used to label a list item in the copy text may be used as the value of the global n attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the n attribute on the \leq item \geq element is by definition synonymous with the use of the \leq label \geq element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the \leq label \geq element, not n .		
Example	<pre>t rend="numbered"></pre>		
Content model	<content> <macroref key="macro.specialPara"></macroref> </content>		
Schema Declaration	<pre>element item { att.global.attributes, att.sortable.attributes, macro.specialPara }</pre>		

5.1.39. <keywords>

keywords> (keywords) contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]

Module	header
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.facs (@facs)) (att.global.change (@change)) (at- t.global.responsibility (@cert, @resp)) (att.global.source (@source)) scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a <taxonomy> element, or by some other resource. Status Optional Datatype teidata.pointer</taxonomy>
Contained by	header: textClass
May contain	core: term
Note	Each individual keyword (including compound subject headings) should be supplied as a term > element directly within the text-words > element. An alternative usage, in which each term > appears within an titem > inside a tist > is permitted for backwards compatibility, but is deprecated. If no control list exists for the keywords used, then no value should be supplied for the scheme attribute.
Example	<pre><keywords scheme="http://classificationweb.net"> <term>Babbage, Charles</term> <term>Mathematicians - Great Britain - Biography</term> </keywords></pre>
Example	<pre><keywords> <term>Fermented beverages</term> <term>Central Andes</term> <term>Schinus molle</term> <term>Molle beer</term> <term>Indigenous peoples</term> <term>Ethnography</term> <term>Archaeology</term> </keywords></pre>

May contain	Empty element
Note	By convention, \leq 1b \geq elements should appear at the point in the text where a new line starts. The n attribute, if used, indicates the number or other value associated with the text between this point and the next \leq 1b \geq element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the \leq 1 \geq 1 element is available) except in circumstances where structural units cannot otherwise be marked. The $type$ attribute may be used to characterize the line break in any respect. The more specialized attributes $break$, ed , or $edRef$ should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.
Example	This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:
	<pre><1>0f Mans First Disobedience,<lb ed="1674"></lb> and<lb ed="1667"></lb> the Fruit <1>0f that Forbidden Tree, whose<lb ed="1667 1674"></lb> mortal tast <1>Brought Death into the World,<lb ed="1667"></lb> and all<lb ed="1674"></lb> our woe,</pre>
Example	This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The <i>break</i> attribute is used to show that the line break does not (as elsewhere) mark the start of a new word. <pre> <titlepart></titlepart></pre>
Content model	<pre> <content> <empty></empty> </content></pre>

5.1.45. < list>

(list) contains	any sequence of items or	ganized as a list. [3.8. Lists]
Module	core		
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition) (@rend, @style, @rendition)) (att.global.facs) (@facs)) (att.global.change) (@change) (t.global.responsibility) (@cert, @resp)) (att.global.source) (@source)) att.sortable (@att.typed) (type, @subtype)		att.global.facs (@facs)) (att.global.change (@change)) (at-
	type	(type) describ	bes the nature of the items in the list.
		Derived from	att.typed
		Status	Optional
		Datatype	teidata.enumerated
		Suggested values include:	gloss (gloss) each list item glosses some term or concept, which is given by a < <u>label></u> element preceding the list item.
			in-dex (index) each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.
			in-
			struc (instructions) each list item is a step in a se- tions quence of instructions, as in a recipe.
			litany (litany) each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.
			syl-lo- (syllogism) each list item is part of an argumentgismconsisting of two or more propositions and a final conclusion derived from them.
		Note	Previous versions of these Guidelines recommended the use of $type$ on $\leq \underline{\text{list}} \geq$ to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the $rend$ or $style$ attributes for these aspects of a list, while using $type$ for

	the more appropriate task of characterizing the nature of the content of a list. The formal syntax of the element declarations allows <a href<="" th="">

Contained by	core: del desc head hi item note p q ref textLang title unclear figures: cell header: abstract change licence revisionDesc namesdates: occupation textstructure: div postscript salute signed transcr: metamark
May contain	core: desc head item label lb note pb textstructure: byline closer dateline opener postscript salute signed transcr: metamark space
Note	May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.
Example	<pre>trend="numbered"> <item>a butcher</item> <item>a baker</item> <item>a candlestick maker, with <list rend="bulleted"> <item>rings on his fingers</item> <item>bells on his toes</item> </list> </item></pre>
Example	<pre>t type="syllogism" rend="bulleted"> <item>All Cretans are liars.</item> <item>Epimenides is a Cretan.</item> <item>ERGO Epimenides is a liar.</item> </pre>
Example	<pre>type="litany" rend="simple"> <item>God save us from drought.</item> <item>God save us from pestilence.</item> <item>God save us from wickedness in high places.</item> <item>Praise be to God.</item> </pre>
Example	The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):
	<pre>daiv1 type="section"></pre>

```
120 shillings to the king; and he who appeals to the king before he demands justice a
                                               often as he ought, is to pay the same fine as the other would have done, if he had
                                               refused him justice.
                                            <list rend="numbered">
                                              <item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes
                                                    known about him, is to forfeit the slave and be liable to his wergild on the firs
                                              occasionp if he does it more often, he is to be liable to pay all that he owns.</ri>
citem n="3.2">And likewise any of the king's treasurers or of our reeves, who has been
                                                    an accessory of thieves who have committed theft, is to liable to the same.</item
                                             </list>
                                            </item>
                                            <item n="4">Concerning treachery to a lord. And we have pronounced concerning treachery
    a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is
                                               afterwards convicted at the three-fold ordeal.</item>
                                           </list>
                                          </div1>
                                      Note that nested lists have been used so the tagging mirrors the structure indicated by the
                                      two-level numbering of the clauses. The clauses could have been treated as a one-level list
                                      with irregular numbering, if desired.
                                          These decrees, most blessed Pope Hadrian, we propounded in the public council ... and tl confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards
Example

Note	When this element appears within the < <u>creation></u> element it documents the set of revision campaigns or stages identified during the evolution of the original text. When it appears within the < <u>revisionDesc></u> element, it documents only changes made during the evolution of the encoded representation of that text.		
Example	<pre><revisiondesc> clistChange> <change when="1991-11-11" who="#LB"> deleted chapter 10 </change> <change when="1991-11-02" who="#MSM"> completed first draft </change> </revisiondesc></pre>		
Example	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>		
Content model	<pre><content> <sequence> <elementref key="desc" maxoccurs="unbounded" minoccurs="0"></elementref> <alternate maxoccurs="unbounded" minoccurs="1"> <elementref key="listChange"></elementref></alternate></sequence></content></pre>

	character data
ļ	
Example	In the following example, the translator has supplied a footnote containing an explanation of
	the term translated as "painterly":
	And yet it is not only
	in the great line of Italian renaissance art, but even in the
	<pre>painterly <note place="bottom" resp="#MDMH" type="gloss"></note></pre>
	<pre><term xml:lang="de">Malerisch</term>. This word has, in the German, two</pre>
	distinct meanings, one objective, a quality residing in the object,
	the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as
	<pre><mentioned>picturesque</mentioned> and</pre>
	<pre><mentioned>painterly</mentioned> respectively. style of the</pre>
	Dutch genre painters of the seventeenth century that drapery has this
	psychological significance.
	elsewhere in the document
	<pre><== elsewhere in the document ==> <respstmt xml:id="MDMH"></respstmt></pre>
	<pre><resp>translation from German to English</resp></pre>
	<name>Hottinger, Marie Donald Mackie</name>
	-
	For this example to be valid, the code MDMH must be defined elsewhere, for example by
	means of a responsibility statement in the associated TEI header.
Example	The global <i>n</i> attribute may be used to supply the symbol or number used to mark the note's
	point of attachment in the source text, as in the following example:
	Mevorakh b. Saadya's mother, the matriarch of the family during the second half of the eleventh century, <note anchored="true" n="126"> The</note>
	alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact, a reference to
	Judah's children; cf. above, nn. 111 and 54. is well known from Geniza documents
	published by Jacob Mann.
	However, if notes are numbered in sequence and their numbering can be reconstructed auto-
	matically by processing software, it may well be considered unnecessary to record the note
	numbers.

5.1.79. <*q*>

<q> (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used. [3.3.3. Quotation]

distance, quotations fro	m elsewhere, and passages that are ment	tioned but not used. [3.3.3. Quotation]
Module	core	
Attributes	(@rend, @style, @rendition)) (a	:lang, @xml:base, @xml:space) (att.global.rendition att.global.facs (@facs)) (att.global.change (@change)) (at- @resp)) (att.global.source (@source)) att.ascribed.directed no))
	type (type) may be thought, or to	e used to indicate whether the offset passage is spoken or o characterize it more finely.
	Status	Optional
	Datatype	teidata.enumerated
	Suggested values in-	spo-ken (spoken) representation of speech
	clude:	thought (thought) representation of thought, e.g. internal monologue
		writ- ten (written) quotation from a written source
		so- Calledo called) authorial distance
		for- eign (foreign)
		<pre>dis- tinct(distinct) linguistically distinct</pre>
		term technical term
		emph (emph) rhetorically emphasized
		men- tione(dnentioned) refering to itself, not its normal referent
Member of	model.common model.hiLike	
Contained by	q ref resp rs street term textLang figures: cell header: authority change creation msdescription: collection institt namesdates: affiliation birth co- orgName persName placeName	on language licence principal ution origDate origPlace repository untry death forename nameLink nationality occupation
May contain	core: abbr address bibl date del rs term title unclear figures: table header: idno msdescription: msDesc origDat	forename geo <u>listEvent</u> <u>listOrg listPerson</u> <u>listPlace location</u>

	character data
Note	May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, $\leq q \geq$ may be thought of as syntactic sugar for $\leq hi \geq$ with a value of <i>rend</i> that indicates the use of such mechanisms as quotation marks.
Example	It is spelled <q>Tübingen</q> — to enter the letter <q>u</q> with an umlaut hold down the <q>option</q> key and press <q>0 0 f c</q>

	Name settlement surname				
	transcr: metamark space				
	character data				
Note	When this element appears within an <index> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its content is to be regarded as a technical or specialised term. It may be associated with a <gloss> element by means of its ref attribute; alternatively a <gloss> element may point to a <term> element by means of its target attribute. In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <term> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <term> element to be used by practitioners of any persuasion. As with other members of the att.canonical class, instances of this element occuring in a text may be associated with a canonical definition, either by means of a URI (using the ref attribute), or by means of some system-specific code value (using the key attribute). Because the mutually exclusive target and cRef attributes overlap with the function of the ref attribute, they are deprecated and may be removed at a subsequent release.</term></term></term></gloss></gloss></index>				
Example	A computational device that infers structure from grammatical strings of words is known as a <term>parser</term> , and much of the history of NLP over the last 20 years has been occupied with the design of parsers.				
Example	We may define <term rend="sc" xml:id="TDPV1">discoursal point of view</term> as <gloss target="#TDPV1">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss>				
Example	We may define <term ref="#TDPV2" rend="sc">discoursal point of view</term> as <gloss xml:id="TDPV2">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss>				
Example	We discuss Leech's concept of <term ref="myGlossary.xml#TDPV2" rend="sc">discoursal point of</term>

5.1.101. <textLang>

<textLang> (text language) describes the languages and writing systems identified within the bibliographic work being described, rather than its description. [3.12.2.4. Imprint, Size of a Document, and Reprint Information 10.6.6. Languages and Writing Systems]

2 3				
Module	core	core		
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.facs (@facs)) (att.global.change (@change)) (t.global.responsibility (@cert, @resp)) (att.global.source (@source)) mainLang (main language) supplies a code which identifies the chief language in the bibliographic work. Status Required Datatype teidata.language		att.global.facs (@facs)) (att.global.change (@change)) (at- presp)) (att.global.source (@source)) ge) supplies a code which identifies the chief language used traphic work. Required	
	otherLangs	`	ges) one or more codes identifying any other languages ibliographic work. Recommended 0-# occurrences of teidata.language separated by whitespace	
Contained by	core: bibl			
May contain	core: abbr address bibl date del desc distinct foreign hi label lb list name note num p pb q ref rs term title unclear figures: table header: idno msdescription: msDesc origDate origPlace namesdates: affiliation country forename geo listEvent listOrg listPerson listPlace location nameLink orgName persName placeName settlement surname transcr: metamark space character data			
Note	This element should not be used to document the languages or writing systems used for the bibliographic or manuscript description itself: as for all other TEI elements, such information should be provided by means of the global <i>xml:lang</i> attribute attached to the element containing the description.			

	In all cases, languages should be identified by means of a standardized 'language tag' generated according to BCP 47. Additional documentation for the language may be provided by a <language> element in the TEI header.</language>		
Example	<pre><textlang mainlang="en" otherlangs="la"> Predominantly in English with Latin glosses</textlang></pre>		
Content model	<content> <macroref key="macro.specialPara"></macroref> </content>		
Schema Declaration	<pre>element textLang { att.global.attributes, attribute mainLang { text }, attribute otherLangs { list { * } }?, macro.specialPara }</pre>		

5.1.102. <title>

<title> (title) contains a title for any kind of work. [3.12.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.5. The Series Statement]</th></tr><tr><td>Module</td><td>core</td><td colspan=3>core</td></tr><tr><td>Attributes</td><td>(@rend, @style
t.global.respons
@ref) att.databl
@from, @to)) (
@to-iso)) (att.d</td><td colspan=4>att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.facs (@facs)) (att.global.change (@change)) (at- t.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.canonical (@key, @ref) att.datable (@calendar, @period) (att.datable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)) att.typed (type, @subtype) type classifies the title according to some convenient typology. Derived att.typed from</td></tr><tr><td rowspan=9></td><td></td><td>Status</td><td>Optional</td></tr><tr><td></td><td>Datatype</td><td>teidata.enumerated</td></tr><tr><td></td><td>Sample val-
ues include:</td><td>main main title</td></tr><tr><td></td><td></td><td>sub (subordinate) subtitle, title of part alt (alternate) alternate title, often in another language, by which the work is also known short abbreviated form of title de- sc (descriptive) descriptive paraphrase of the work</td></tr><tr><td></td><td>Note</td><td>functioning as a title This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <title> element.</td></tr><tr><td>level</td><td></td><td>ibliographic level for a title, that is, whether it identifies an ournal, series, or unpublished material.</td></tr><tr><td></td><td>Status</td><td>Optional</td></tr><tr><td></td><td>Datatype</td><td>teidata.enumerated</td></tr><tr><td></td><td>Legal values are:</td><td>a</td></tr></tbody></table></title>					
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--	--	--	--	--

	Note	(analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item. m (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper s (series) the title applies to a series of otherwise distinct publications such as a collection u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press) The level of a title is sometimes implied by its context: for example, a title appearing directly within an <ana-< th=""></ana-<>		
		lytic> element is <i>ipso facto</i> of level 'a', and one appearing within a <series> element of level 's'. For this reason, the <i>level</i> attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.</series>

5.2. Model classes

5.2.1. model.addrPart

model.addrPart groups elements such as names or postal codes which may appear as part of a postal address. [3.6.2. Addresses]		
Module	tei	
Used by	address	
Members	model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike model.persNamePart[forename nameLink surname] model.placeStateLike[model.place-NamePart[country placeName settlement] location] idno rs] addrLine postCode street	

5.2.2. model.addressLike

model.addressLike groups elements used to represent a postal or email address. [1. The TEI Infrastructure]	
Module	tei
Used by	location model.pPart.data
Members	address affiliation

5.2.3. model.attributable

model.attributable groups elements that contain a word or phrase that can be attributed to a source. [3.3.3. Quotation 4.3.2. Floating Texts]	
Module	tei
Used by	macro.phraseSeq model.inter
Members	model.quoteLike

5.2.4. model.availabilityPart

model.availabilityPart groups elements such as licences and paragraphs of text which may appear as part of an availability statement [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei
Used by	availability
Members	licence

5.2.5. model.biblLike

model.biblLike groups elements containing a bibliographic description. [3.12. Bibliographic Citations and References]	
Module	tei
Used by	event location model.inter model.personPart org place
Members	bibl msDesc

5.2.6. model.common

model.common groups common chunk- and inter-level elements. [1.3. The TEI Class System]		
Module	tei	
Used by	div postscript	
Members	<u>model.divPart[model.lLike model.pLike[p]] model.inter[model.attributable[model.quote-Like] model.biblLike[bibl msDesc] model.egLike model.labelLike[desc label] model.list-Like[list listEvent listOrg listPerson listPlace table] model.oddDecl model.stageLike] q</u>	
Note	This class defines the set of chunk- and inter-level elements; it is used in many content models, including those for textual divisions.	

5.2.7. model.dateLike

model.dateLike groups elements containing temporal expressions. [3.6.4. Dates and Times 13.4. Dates]

Module	tei
Used by	model.pPart.data
Members	date

5.2.8. model.descLike

model.descLike groups elements which contain a description of their function.	
Module	tei
Used by	space
Members	desc

5.2.9. model.divBottom

model.divBottom groups elements appearing at the end of a text division. [4.2. Elements Common to All Divisions]	
Module	tei
Used by	div list table
Members	model.divBottomPart[closer postscript signed] model.divWrapper[byline dateline salute]

5.2.10. model.divBottomPart

model.divBottomPart groups elements which can occur only at the end of a text division. [4.6. Title Pages]	
Module	tei
Used by	model.divBottom postscript
Members	closer postscript signed

5.2.11. model.divLike

model.divLike groups elements used to represent un-numbered generic structural divisions.	
Module	tei
Used by	div
Members	<u>div</u>

5.2.12. model.divPart

model.divPart groups paragraph-level elements appearing directly within divisions. [1.3. The TEI Class System]	
Module	tei
Used by	macro.specialPara model.common
Members	model.lLike model.pLike[p]
Note	Note that this element class does not include members of the model.inter class, which can appear either within or between paragraph-level items.

5.2.13. model.divTop

model.divTop groups elements appearing at the beginning of a text division. [4.2. Elements Common to All Divisions]	
Module	tei
Used by	div list
Members	model.divTopPart[model.headLike[head] opener signed] model.divWrapper[byline dateline salute]

5.2.14. model.divTopPart

model.divTopPart groups elements which can occur only at the beginning of a text division. [4.6. Title Pages]	
Module	tei
Used by	model.divTop postscript

Members	model.headLike[head] opener signed
---------	------------------------------------

5.2.15. model.divWrapper

model.divWrapper groups elements which can appear at either top or bottom of a textual division. [4.2. Elements Commor to All Divisions]	
Module	tei
Used by	model.divBottom model.divTop
Members	byline dateline salute

5.2.16. model.emphLike

model.emphLike groups phrase-level elements which are typographically distinct and to which a specific function can be attributed. [3.3. Highlighting and Quotation]	
Module	tei
Used by	model.highlighted model.limitedPhrase
Members	distinct foreign term title

$5.2.17.\ model. encoding Desc Part$

model.encodingDescPart groups elements which may be used inside encodingDesc and appear multiple times.	
Module	tei
Used by	encodingDesc
Members	<u>projectDesc</u>

5.2.18. model.eventLike

model.eventLike groups elements which describe events.	
Module	tei
Used by	listEvent model.orgPart model.personPart place
Members	event listEvent

5.2.19. model.global

model.global groups elements which may appear at any point within a TEI text. [1.3. The TEI Class System]	
Module	tei
Used by	address byline closer date dateline div head list macro.phraseSeq macro.phraseSeq.limited macro.specialPara model.paraPart opener origDate person postscript table text
Members	model.global.edit[space] model.global.meta model.milestoneLike[lb pb] model.note- Like[note] metamark

5.2.20. model.global.edit

model.global.edit groups globally available elements which perform a specifically editorial function. [1.3. The TEI Class System]	
Module	tei
Used by	model.global
Members	space

5.2.21. model.headLike

model.headLike groups elements used to provide a title or heading at the start of a text division.	
Module	tei
Used by	event listEvent listOrg listPerson listPlace model.divTopPart msDesc org place table
Members	<u>head</u>

5.2.22. model.hiLike

model.hiLike groups phrase-level elements which are typographically distinct but to which no specific function can be attributed. [3.3. Highlighting and Quotation]	
Module	tei
Used by	model.highlighted model.limitedPhrase
Members	<u>hi</u> <u>q</u>

5.2.23. model.highlighted

model.highlighted groups phrase-level elements which are typographically distinct. [3.3. Highlighting and Quotation]	
Module	tei
Used by	model.phrase
Members	model.emphLike[distinct foreign term title] model.hiLike[hi q]

5.2.24. model.inter

model.inter groups elements which can appear either within or between paragraph-like elements. [1.3. The TEI Class System]	
Module	tei
Used by	head macro.limitedContent macro.specialPara model.common model.paraPart
Members	<u>model.attributable</u> [model.quoteLike] <u>model.biblLike[bibl msDesc]</u> model.egLike <u>model.labelLike[desc label]</u> <u>model.listLike[list listEvent listOrg listPerson listPlace table]</u> model.oddDecl model.stageLike

5.2.25. model.labelLike

model.labelLike groups elements used to gloss or explain other parts of a document.	
Module	tei
Used by	event location model.inter org place
Members	desc label

5.2.26. model.limitedPhrase

model.limitedPhrase groups phrase-level elements excluding those elements primarily intended for transcription of existing sources. [1.3. The TEI Class System]	
Module	tei
Used by	creation macro.limitedContent macro.phraseSeq.limited
Members	model.emphLike[distinct foreign term title] model.hiLike[hi q] model.pPart.data[model.addressLike[address affiliation] model.dateLike[date] model.measureLike[geo num] model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike model.persNamePart[forename nameLink surname] model.placeStateLike[model.placeNamePart[country placeName settlement] location] idno rs]] model.pPart.editorial[abbr] model.pPart.msdesc[origDate origPlace] model.phrase.xml model.ptrLike[ref]

5.2.27. model.listLike

model.listLike groups list-like elements. [3.8. Lists]	
Module	tei
Used by	abstract model.inter
Members	list listEvent listOrg listPerson listPlace table

5.2.28. model.measureLike

model.measureLike groups elements which denote a number, a quantity, a measurement, or similar piece of text that con-	
veys some numerical meaning. [3.6.3. Numbers and Measures]	
Module	tei

Used by	location model.pPart.data
Members	geo num

5.2.29. model.milestoneLike

model.milestoneLike groups milestone-style elements used to represent reference systems. [1.3. The TEI Class System 3.11.3. Milestone Elements]	
Module	tei
Used by	model.global org
Members	<u>lb pb</u>

5.2.30. model.nameLike

model.nameLike groups elements which name or refer to a person, place, or organization.	
Module	tei
Used by	model.addrPart model.pPart.data org
Members	model.nameLike.agent[name orgName persName] model.offsetLike model.per-sNamePart[forename nameLink surname] model.placeStateLike[model.place-NamePart[country placeName settlement] location] idno rs
Note	A superset of the naming elements that may appear in datelines, addresses, statements of responsibility, etc.

5.2.31. model.nameLike.agent

model.nameLike.agent groups elements which contain names of individuals or corporate bodies. [3.6. Names, Numbers, Dates, Abbreviations, and Addresses]	
Module	tei
Used by	model.nameLike respStmt
Members	name orgName persName
Note	This class is used in the content model of elements which reference names of people or organizations.

5.2.32. model.noteLike

model.noteLike groups globally-available note-like elements. [3.9. Notes, Annotation, and Indexing]	
Module	tei
Used by	event location model.global org place
Members	note

5.2.33. model.orgPart

model.orgPart groups elements which form part of the description of an organization.	
Module	tei
Used by	org
Members	model.eventLike[event listEvent] listOrg listPerson listPlace

5.2.34. model.pLike

model.pLike groups paragraph-like elements.	
Module	tei
Used by	abstract availability encodingDesc event langUsage model.divPart msDesc org person phys- Desc place projectDesc publicationStmt seriesStmt
Members	р

5.2.35. model.pPart.data

model.pPart.data groups phrase-level elements containing names, dates, numbers, measures, and similar data. [3.6. Names, Numbers, Dates, Abbreviations, and Addresses]	
Module	tei
Used by	model.limitedPhrase model.phrase
Members	model.addressLike[address affiliation] model.dateLike[date] model.measureLike[geo num] model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike model.persNamePart[forename nameLink surname] model.placeStateLike[model.placeNamePart[country placeName settlement] location] idno rs]

5.2.36. model.pPart.edit

model.pPart.edit groups phrase-level elements for simple editorial correction and transcription. [3.5. Simple Editorial Changes]	
Module	tei
Used by	model.phrase
Members	model.pPart.editorial[abbr] model.pPart.transcriptional[del unclear]

5.2.37. model.pPart.editorial

model.pPart.editorial groups phrase-level elements for simple editorial interventions that may be useful both in transcribing and in authoring. [3.5. Simple Editorial Changes]	
Module	tei
Used by	model.limitedPhrase model.pPart.edit
Members	<u>abbr</u>

5.2.38. model.pPart.msdesc

model.pPart.msdesc groups phrase-level elements used in manuscript description. [10. Manuscript Description]	
Module	tei
Used by	model.limitedPhrase model.phrase
Members	origDate origPlace

5.2.39. model.pPart.transcriptional

model.pPart.transcriptional groups phrase-level elements used for editorial transcription of pre-existing source materials. [3.5. Simple Editorial Changes]	
Module	tei
Used by	model.pPart.edit
Members	del unclear

5.2.40. model.paraPart

model.paraPart groups elements that may appear in paragraphs and similar elements [3.1. Paragraphs]	
Module	tei
Used by	macro.paraContent
Members	model.gLike model.global[model.global.edit[space] model.global.meta model.milestone-Like[lb pb] model.noteLike[note] metamark] model.inter[model.attributable[model.quote-Like] model.biblLike[bibl msDesc] model.egLike model.labelLike[desc label] model.list-Like[list listEvent listOrg listPerson listPlace table] model.oddDecl model.stageLike] model.lLike model.phrase[model.graphicLike model.highlighted[model.emphLike[distinct foreign term title] model.hiLike[hi q]] model.lPart model.pPart.data[model.addressLike[address affiliation] model.dateLike[date] model.measureLike[geo num] model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike model.persNamePart[forename nameLink surname] model.placeStateLike[model.placeNamePart[country placeName]

5.2.41. model.persNamePart

model.persNamePart groups elements which form part of a personal name. [13.2.1. Personal Names]	
Module	namesdates
Used by	model.nameLike
Members	forename nameLink surname

5.2.42. model.persStateLike

model.persStateLike groups elements describing changeable characteristics of a person which have a definite duration, for example occupation, residence, or name.	
Module	tei
Used by	model.personPart
Members	affiliation nationality occupation persName sex
Note	These characteristics of an individual are typically a consequence of their own action or that of others.

5.2.43. model.personLike

model.personLike groups elements which provide information about people and their relationships.	
Module	tei
Used by	listPerson org
Members	org person

5.2.44. model.personPart

model.personPart groups elements which form part of the description of a person. [15.2.2. The Participant Description]	
Module	tei
Used by	<u>person</u>
Members	model.biblLike[bibl msDesc] model.eventLike[event listEvent] model.persStateLike[affiliation nationality occupation persName sex] birth death idno name

5.2.45. model.phrase

model.phrase groups elements which can occur at the level of individual words or phrases. [1.3. The TEI Class System]	
Module	tei
Used by	byline closer date dateline head macro.phraseSeq macro.specialPara model.paraPart opener origDate
Members	model.graphicLike model.highlighted[model.emphLike[distinct foreign term title] model.hi-Like[hi q]] model.lPart model.pPart.data[model.addressLike[address affiliation] model.date-Like[date] model.measureLike[geo num] model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike model.persNamePart[forename nameLink surname] model.placeStateLike[model.placeNamePart[country placeName settlement] location] idno rs]] model.pPart.edit[model.pPart.editorial[abbr] model.pPart.transcriptional[del unclear]] model.pPart.msdesc[origDate origPlace] model.phrase.xml model.ptrLike[ref] model.seg-Like model.specDescLike
Note	This class of elements can occur within paragraphs, list items, lines of verse, etc.

5.2.46. model.placeLike

model.placeLike groups elements used to provide information about places and their relationships.	
Module	tei
Used by	listPlace org place

Members	place
---------	-------

5.2.47. model.placeNamePart

model.placeNamePart groups elements which form part of a place name. [13.2.3. Place Names]	
Module	tei
Used by	location model.placeStateLike msIdentifier
Members	country placeName settlement

5.2.48. model.placeStateLike

model.placeStateLike groups elements which describe changing states of a place.	
Module	tei
Used by	model.nameLike place
Members	model.placeNamePart[country placeName settlement] location

5.2.49. model.profileDescPart

model.profileDescPart groups elements which may be used inside <pre><pre>profileDesc></pre> and appear multiple times.</pre>	
Module	tei
Used by	<u>profileDesc</u>
Members	abstract creation langUsage textClass

5.2.50. model.ptrLike

model.ptrLike groups elements used for purposes of location and reference. [3.7. Simple Links and Cross-References]	
Module	tei
Used by	model.limitedPhrase model.phrase model.publicationStmtPart.detail
Members	<u>ref</u>

5.2.51. model.publicationStmtPart.agency

model.publicationStmtPart.agency groups the child elements of a specific element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei
Used by	publicationStmt
Members	<u>authority</u>
Note	The 'agency' child elements, while not required, are required if one of the 'detail' child elements is to be used. It is not valid to have a 'detail' child element without a preceding 'agency' child element. See also model.publicationStmtPart.detail.

5.2.52. model.publicationStmtPart.detail

model.publicationStmtPart.detail groups the agency-specific child elements of the spublicationStmt element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei
Used by	publicationStmt
Members	model.ptrLike[ref] address availability date idno
Note	A 'detail' child element may not occur unless an 'agency' child element precedes it. See also model.publicationStmtPart.agency.

5.2.53. model.resource

model.resource groups separate elements which constitute the content of a digital resource, as opposed to its metadata. [1.3. The TEI Class System]	
Module	tei

Used by	<u>TEI</u>
Members	<u>text</u>

5.2.54. model.respLike

model.respLike groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.				
Module	ei			
Used by	titleStmt			
Members	author principal respStmt			

5.2.55. model.teiHeaderPart

model.teiHeaderPart groups high level elements which may appear more than once in a TEI header.				
Module	tei			
Used by	teiHeader			
Members	encodingDesc profileDesc			

5.3. Attribute classes

5.3.1. att.anchoring

Module	tei				
Members	note				
Attributes	anchored		(anchored) indicates whether the copy text shows the exact place of reference for the note.		
		Status	Optional		
		Datatype	teidata.truthValue		
		Default	true		
		Note	In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. 'page 218, lines 3–4'). The <i>anchored</i> attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an explicit location is indicated in the copy text; the value false indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols used in the copy text at the location the note is anchored are to be recorded, use the <i>n</i> attribute.		
	targetEnd		points to the end of the span to which the note is attached, if of embedded in the text at that point.		
		Status	Optional		
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space		
		Note	This attribute is retained for backwards compatibility; it may be removed at a subsequent release of the Guidelines. The recommended way of pointing to a span of elements is by means of the range function of XPointer, as further described in 16.2.4.6. range().		

1	<note xml:lang="pl"> Quatuor Tempora, tzw. Suche dni postne.</note>

5.3.2. att.ascribed

att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts] Members att.ascribed.directed[q] change Attributes indicates the person, or group of people, to whom the element content is who ascribed. Status Optional 1-# occurrences of teidata.pointer separated by white-**Datatype** In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <castItem> elements in the <castList> using the who attribute. <castItem type="role"> <role xml:id="Barnardo">Bernardo</role>
</castItem> <castItem type="role"> <role xml:id="Francisco">Francisco</role>
<roleDesc>a soldier</roleDesc> </castItem> <sp who="#Barnardo"> <speaker>Bernardo</speaker>
<l n="1">Who's there?</l> </sp>
<sp who="#Francisco"> <speaker>Francisco</speaker>
<1 n="2">Nay, answer me: stand, and unfold yourself.</l> For transcribed speech, this will typically identify a par-Note ticipant or participant group; in other contexts, it will point to any identified element.

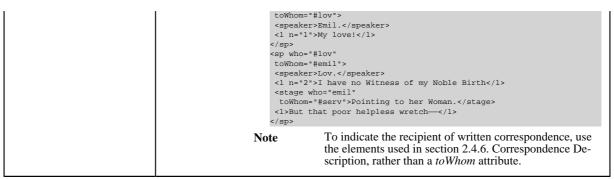

5.3.3. att.ascribed.directed

att.ascribed.directed provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module tei

Members

Members	<u>q</u>			
Attributes	att.ascribed (@	scribed (@who)		
	toWhom	indicates the person, or group of people, to whom a speech act or action is directed.		
		Status	Optional	
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space	
		(<sp>) in the the <casti fy="" s<="" td="" the="" who=""><td>wing example from Mary Pix's The False Friend, speeches ne body of the play are linked to <castitem> elements in dist> using the toWhom attribute, which is used to specipeech is directed to. 5.3.5. att.cReferencing

att.cReferencing provides attributes that may be used to supply a *canonical reference* as a means of identifying the target of a pointer.

of a pointer.			
Module	tei		
Members	ref term		
Attributes	cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a <refsdecl> element in the TEI header</refsdecl>		
		Status	Optional
		Datatype	<u>teidata.text</u>
		Note	The value of <i>cRef</i> should be constructed so that when the algorithm for the resolution of canonical references (de-

scribed in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.

The <refsDecl> to use may be indicated with the decls attribute.

Currently these Guidelines only provide for a single canonical reference to be encoded on any given <ptr>
element.

5.3.6. att.canonical

att.canonical provides attributes that can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [13.1.1. Linking Names and Their Referents] Module Members att.naming[att.personal[forename name orgName persName placeName surname] affiliation author birth collection country death event institution nationality occupation origPlace repository rs settlement] authority date principal resp respStmt term title Attributes key provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind. Status Optional **Datatype** teidata.text type="organisation">[New Zealand Parliament, Legislative Council]</name> </author> <name key="Hugo, Victor (1802-1885)"
ref="http://www.idref.fr/026927608">Victor Hugo</name> The value may be a unique identifier from a database, or Note any other externally-defined string identifying the refer-No particular syntax is proposed for the values of the key attribute, since its form will depend entirely on practice within a given project. For the same reason, this attribute is not recommended in data interchange, since there is no way of ensuring that the values used by one project are distinct from those used by another. In such a situation, a preferable approach for magic tokens which follows standard practice on the Web is to use a ref attribute whose value is a tag URI as defined in RFC 4151. ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs. Status Optional **Datatype** 1-# occurrences of teidata.pointer separated by white-<name ref="http://viaf.org/viaf/109557338"</pre> type="person">Seamus Heaney</name The value must point directly to one or more XML ele-Note ments or other resources by means of one or more URIs, separated by whitespace. If more than one is supplied the implication is that the name identifies several distinct en-

5.3.7. att.datable

att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.6.4. Dates and Times 13.4. Dates]			
Module	tei		
Members	affiliation author birth change country creation date death event idno licence location name nationality occupation orgName origDate origPlace persName placeName principal resp settlement sex title		

Attributes	att.datable.w3c (@when, @notBefore, @notAfter, @from, @to) att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso) att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)					
	calendar	indicates one or more systems or calendars to which the date represented by the content of this element belongs.				
		Status	Optional			
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space			
		Schematron	<pre><sch:rule context="tei:*[@calendar]"> <sch:as- sert="" test="string-length(normalize-space(.)) gt 0"> @calendar indicates one or more systems or calendars to which the date represented by the content of this ele- ment belongs, but this <sch:name></sch:name> element has no tex- tual content. </sch:as-></sch:rule></pre>			
			n on <date calendar="#gregorian">Feb. 22, 1732</date> (<date 2-02-22"="">Feb. 11, 1731/32, e>).</date>	calendar="#julian"		
		when="173	rn on <date <br="" calendar="#gregorian #julian">2-02-22">Feb. 22, 1732 1731/32, O.S.)</date> .			
		Note	Note that the <i>calendar</i> attribute (unlike <i>datingMethod</i> defined in att.datable.custom) defines the calendar system of the date in the original material defined by the parent element, <i>not</i> the calendar to which the date is normalized.			
	period	(typically <ca< th=""><th>ers to one or more definitions of named periods of time ategory>s or <calendar>s) within which the datable tood to have occurred.</calendar></th><th></th></ca<>	ers to one or more definitions of named periods of time ategory>s or <calendar>s) within which the datable tood to have occurred.</calendar>			
		Status	Optional			
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white-space			
Note	poral information. the module for nar ble.iso and att.da ed to the W3C data However, the grea	By default, the mes & dates is latable.custom atypes form a ster expressiven	tes that can be used to provide normalized values of temerattributes from the att.datable.w3c class are provided. If loaded, this class also provides attributes from the att.dataclasses. In general, the possible values of attributes restrictions of those values available via the ISO 8601 standard. Less of the ISO datatypes may not be needed, and there extended the transfer of the W3C datatypes.			

5.3.8. att.datable.custom

att.datable.custom provides attributes for normalization of elements that contain datable events to a custom dating system (i.e. other than the Gregorian used by W3 and ISO). [13.4. Dates]

Module

namesdates

Module	namesdates		
Members	att.datable[affiliation author birth change country creation date death event idno licence location name nationality occupation orgName origDate origPlace persName placeName principal resp settlement sex title]		
Attributes	when-custom	Status Datatype The following valid ISO or ing system Alhazen date when when - cus	alue of a date or time in some custom standard form. Optional 1—# occurrences of teidata.word separated by whitespace g are examples of custom date or time formats that are not W3C format normalizations, normalized to a different dat- died in Cairo on the ="1040-03-06" tom="431-06-12"> 12th day of Jumada t-Tania, 430 AH /p> rent world will end at the

Not all custom date formulations will have Gregorian equivalents. The *when-custom* attribute and other custom dating are not constrained to a datatype by the TEI, but individual projects are recommended to regularize and document their dating formats.

notBefore-custom specifies the earliest possible date for the event in some custom standard form.

Status Optional

Datatype 1-# occurrences of <u>teidata.word</u> separated by whitespace

notAfter-custom specifies the latest possible date for the event in some custom standard form.

Status Optional

Datatype 1-# occurrences of <u>teidata.word</u> separated by whitespace

from-custom indicates the starting point of the period in some custom standard form.

Status Optional

Datatype 1–# occurrences of <u>teidata.word</u> separated by whitespace

```
<event xml:id="FIRE1"
datingMethod="#julian"
from-custom="1666-09-02"
to-custom="1666-09-05">
<head>The Great Fire of London</head>
The Great Fire of London burned through a large part
    of the city of London.
```

to-custom

indicates the ending point of the period in some custom standard form.

Status Optional

Datatype 1–# occurrences of teidata.word separated by whitespace

datingPoint

supplies a pointer to some location defining a named point in time with reference to which the datable item is understood to have occurred

Status Optional

Datatype <u>teidata.pointer</u>

datingMethod

supplies a pointer to a <calendar> element or other means of interpreting the values of the custom dating attributes.

Status Optional

Datatype <u>teidata.pointer</u>

```
Contayning the Originall, Antiquity, Increa#e, Moderne e#tate, and de#cription of that Citie, written in the yeare <date when-custom="1598" calendar="#julian" datingMethod="#julian">1598</date>. by Iohn Stow Citizen of London.
```

In this example, the *calendar* attribute points to a <calendar> element for the Julian calendar, specifying that the text content of the <a href="mailto:date> element is a Julian date, and the *datingMethod* attribute also points to the Julian calendar to indicate that the content of the *whencustom* attribute value is Julian too.

```
<date when="1382-06-28"
when-custom="6890-06-20"
datingMethod="#creationOfWorld"> µ### ####### ### <num>#</num> ##### <num>#### <num>#### <num>####</num></date>
```

In this example, a date is given in a Mediaeval text measured 'from the creation of the world', which is normalized (in *when*) to the Gregorian

Thu 18 May</dat

date, but is also normalized (in when-custom) to a machine-actionable, numeric version of the date from the Creation.

Note that the datingMethod attribute (unlike calendar defined in att.datable) defines the calendar or dating system to which the date described by the parent element is normalized (i.e. in the *when-custom* or other *X-custom* attributes), *not* the calendar of the original date in the ele-

5.3.9. att.datable.iso

Module	namesdates	namesdates				
Members		tion author birth change country creation date death event idno licence lo- onality occupation orgName origDate origPlace persName placeName prin- ent sex title]				
Attributes	when-iso	supplies the	value of a date or time in a standard form.			
		Status	Optional			
		Datatype	teidata.temporal.iso			
			ng are examples of ISO date, time, and date & time formats valid W3C format normalizations.			
		<pre><date <date="" <time="" pre="" whe="" whe<=""></date></pre>	en-iso="1996-09-24T07:25+00">Sept. 24th, 1996 at 3:25 in the monomic of the sept. 24th, 1996 at 3:25 in the monomic of the sept. 24th, 1996 at 3:25 in the monomic of the sept. 24th, 1996 at 3:25 in the monomic of the sept. 24th, 1996 at 3:25 in the monomic of the sept. 25th of the			
		All of the examples of the <i>when</i> attribute in the att.datable.w3c class are also valid with respect to this attribute.				
		He likes to be punctual. I said <q> <time when-iso="12">around noon</time> </q> , and he showed up at <time when-iso="12:00:00">12 0'clock</time> qn				
		The second occurrence of <time> could have been encoded with the when attribute, as 12:00:00 is a valid time with respect to the W3C XML Schema Part 2: Datatypes Second Edition specification. The first occurrence could not.</time>				
	notBefore-iso	specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.				
		Status	Optional			
		Datatype	teidata.temporal.iso			
	notAfter-iso	specifies the yyyy-mm-dd				
		Status	Optional			
		Datatype	teidata.temporal.iso			
	from-iso	indicates the Status	starting point of the period in standard form. Optional			
		Datatype	teidata.temporal.iso			
	to-iso	indicates the	ending point of the period in standard form.			
		Status	Optional			
		Datatype	teidata.temporal.iso			

If both when-iso and dur-iso are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. That is,

| kdate when-iso="2007-06-01" dur-iso="PBD"/>
| indicates the same time period as
| kdate when-iso="2007-06-01/PBD"/>
| In providing a 'regularized' form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.

5.3.10. att.datable.w3c

att.datable.w3c provides attributes for normalization of elements that contain datable events conforming to the W3C XML Schema Part 2: Datatypes Second Edition. [3.6.4. Dates and Times 13.4. Dates] Module Members att.datable[affiliation author birth change country creation date death event idno licence location name nationality occupation orgName origDate origPlace persName placeName principal resp settlement sex title] **Attributes** supplies the value of the date or time in a standard form, e.g. yyyy-mmwhen Status Optional **Datatype** teidata.temporal.w3c Examples of W3C date, time, and date & time formats. -<date when="1945-10-24">24 Oct 45</date>

	Status Optional Datatype teidata.temporal.w3c
Schematron	<pre><sch:rule context="tei:*[@when]"> <sch:report role="nonfatal" test="@notBefore @notAfter @from @to">The @when attribute cannot be used with any other att.datable.w3c attrib- utes.</sch:report> </sch:rule></pre>
Schematron	<pre><sch:rule context="tei:*[@from]"> <sch:report role="nonfatal" test="@notBefore">The @from and @notBefore attributes cannot be used together.</sch:report> </sch:rule></pre>
Schematron	<pre><sch:rule context="tei:*[@to]"> <sch:report role="nonfatal" test="@notAfter">The @to and @notAfter attributes cannot be used together.</sch:report> </sch:rule></pre>
Example	<pre><date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date></pre>
Note	The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar. The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy,mm,dd, yyyy-mm, ormm-dd may also be used. For the time part, the form hh:mm:ss is used. Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

5.3.11. att.declarable

att.declarable provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose decls attribute. [15.3. Associating Contextual Information with a Text] Module availability bibl langUsage listEvent listOrg listPerson listPlace projectDesc seriesStmt Members sourceDesc textClass Attributes default indicates whether or not this element is selected by default when its parent is selected. Status Optional **Datatype** teidata.truthValue Legal values true This element is selected if its parent is selected are: false This element can only be selected explicitly, unless it is the only one of its kind, in which case it is selected if its parent is selected.[Default] The rules governing the association of declarable elements with individual parts of a TEI Note text are fully defined in chapter 15.3. Associating Contextual Information with a Text. Only

5.3.12. att.declaring

att.declaring provides attributes for elements which may be independently associated with a particular declarable element within the header, thus overriding the inherited default for that element. [15.3. Associating Contextual Information with a Text]

one element of a particular type may have a default attribute with a value of true.

Module	tei	
Members	body div geo msDesc p ref term text	
Attributes	decls (declarations) identifies one or more <i>declarable elements</i> within the header, which are understood to apply to the element bearing this attribute and its content. Status Optional Datatype 1-# occurrences of teidata.pointer separated by whitespace	

Note The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text.

5.3.13. att.dimensions

att.dimensions provi	des attributes for describi	ng the size of phy	sical objects.			
Module	tei	tei				
Members	birth date death	birth date death del origDate space unclear				
Attributes	att.ranging (@a	att.ranging (@atLeast, @atMost, @min, @max, @confidence)				
	unit	names the uni	it used for the measurement			
		Status	Optional			
		Datatype	<u>teidata.enumerated</u>			
		Suggested values in- clude:	cm (centimetres)			
			mm (millimetres)			
			in			
			(inches)			
			line			
			lines of text			
			char			
			(characters) characters of text			
	quantity	specifies the length in the units specified				
		Status	Optional			
		Datatype	teidata.numeric			
	extent		size of the object concerned using a project-specific vocab- ing quantity and units in a single string of words. Optional			
		Datatype	teidata.text			
			tt="5 words"/>			
			tent="half the page"/>			
	precision	characterizes Status	the precision of the values specified by the other attributes. Optional			
		Datatype	<u>teidata.certainty</u>			
	scope	where the measurement summarizes more than one observation, specifies the applicability of this measurement.				
		Status	Optional			
		Datatype	teidata.enumerated			
		Sample val- ues include:	all measurement applies to all instances.			
			most measurement applies to most of the instances inspected.			
			range measurement applies to only the specified range of instances.			

5.3.14. att.divLike

att.divLike provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]

Module	tei				
Members	<u>div</u>				
Attributes	att.fragmentable (@part)				
	org	(organization)	specifies how the content of the division is organized.		
		Status	Optional		
		Datatype	teidata.enumerated		
		Legal values are:	com- pos- no claim is made about the sequence in which ite the immediate contents of this division are to be processed, or their inter-relationships.		
			uni- formthe immediate contents of this element are re- garded as forming a logical unit, to be processed in sequence.[Default]		
	sample		indicates whether this division is a sample of the original source and if so, from which part.		
		Status	Optional		
		Datatype	teidata.enumerated		
		Legal values are:	ini- tial division lacks material present at end in source.		
			me- di- division lacks material at start and end. al		
			fi- nal division lacks material at start.		
			un- known sition of sampled material within original un- known.		
			completedivision is not a sample.[Default]		

5.3.15. att.docStatus

att.docStatus provide	es attributes for use on	metadata elements d	escribing the status of a document.
Module	tei		
Members	bibl change	msDesc revisionDesc	2
Attributes	status		

	[Default]
	em- bar- goed
	ex- pired
	frozen
	gal- ley
	pro- posed

	rec- om-
	men- da- tion
	sub- mit- ted
	un- fin-
	ished with-
	drawn
Example	<pre><revisiondesc status="published"> <change status="published" when="2010-10-21"></change> <change status="cleared" when="2010-10-02"></change> <change status="embargoed" when="2010-08-02"></change> <change status="frozen" when="2010-05-01" who="#MSM"></change> <change status="draft" when="2010-03-01" who="#LB"></change></revisiondesc></pre>
	<pre>wild="#uB"/> </pre>

5.3.16. att.editLike

att.editLike provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.5. Simple Editorial Changes 10.3.1. Origination 13.3.2. The Person Element 11.3.1.1. Core Elements for Transcriptional Work]

Workj			
Module	tei		
Members			birth date death event location name nationality occupation persName person place placeName sex unclear
Attributes	of the intervention or interpretation. Status Optional		Optional 1—# occurrences of teidata.enumerated separated by
		Suggested values include:	in-ter- there is internal evidence to support the interven-nal tion.
			ex- ter- there is external evidence to support the interven- nal tion.

			 con- jec- the intervention or interpretation has been made ture by the editor, cataloguer, or scholar on the basis of their expertise.
	instant	indicates wh	ether this is an instant revision or not.
		Status	Optional
		Datatype	teidata.xTruthValue
		Default	false
Note	tervention in a ter scripts etc. Each pointer or reference a biblio	xt, for example in the <i>source</i> (i graphic citation	lass are typically used to represent any kind of editorial inea a correction or interpretation, or to date or localize manuferestation or interpretation as a vitness or witness group should on such as a <witness>, <msdesc>, or <bibl> element, or citation, documenting the source concerned.</bibl></msdesc></witness>

5.3.17. att.edition

Module	4-:			
Module	tei			
Members	<u>lb pb</u>			
Attributes	ed	tion in which	plies a sigil or other arbitrary identifier for the source edi- the associated feature (for example, a page, column, or line s at this point in the text. Optional	
		Datatype	1-# occurrences of teidata.word separated by whitespace	
	edRef	associated fe	(edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.	
		Status	Optional	
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white-space	
Example	<1>Of that	Forbidden Tree, wh	c, <lb ed="1674"></lb> and <lb ed="1667"></lb> the Fruit cose <lb ed="1667 1674"></lb> mortal tast cld, <lb ed="1667"></lb> and all <lb ed="1674"></lb> our woe,	
Example	<pre></pre>	<pre></pre>		

5.3.18. att.fragmentable

att.fragmentable provides attributes for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.			
Module	tei		
Members	att.divLike[div] p		
Attributes	part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech		

which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers. Status Optional teidata.enumerated **Datatype** Legal values Y (yes) the element is fragmented in some (unspecare: ified) respect \mathbf{N} (no) the element is not fragmented, or no claim is made as to its completeness[Default] I (initial) this is the initial part of a fragmented ele- \mathbf{M} (medial) this is a medial part of a fragmented element \mathbf{F} (final) this is the final part of a fragmented element The values I, M, or F should be used only where it is clear how the element may be reconstituted. Note

5.3.19. att.global

att.global provides a	attributes common to all ele	ements in the TE	I encoding scheme. [1.3.1.1. Global Attributes]	
Module	tei			
Members	byline catRef ce tinct div encodi keywords label listPlace locatio cupation opener ceName postCo itory resp respS	TEI abbr abstract addrLine address affiliation author authority availability bibl birth body byline catRef cell change closer collection country creation date dateline death del desc distinct div encodingDesc event fileDesc foreign forename geo head hi idno institution item keywords label langUsage language lb licence list listChange listEvent listOrg listPerson listPlace location metamark msDesc msIdentifier name nameLink nationality note num occupation opener org orgName origDate origPlace p pb persName person physDesc place placeName postCode postscript principal profileDesc projectDesc publicationStmt q ref repository resp respStmt revisionDesc row rs salute seriesStmt settlement sex signed sourceDesc space street surname table teiHeader term text textClass textLang title titleStmt unclear		
Attributes	1 0	(lobal.responsibi (identifier) p tribute. Status	tyle, @rendition) att.global.facs (@facs) att.global.change lity (@cert, @resp) att.global.source (@source) rovides a unique identifier for the element bearing the at-	
		Datatype Note	The <i>xml:id</i> attribute may be used to specify a canonical reference for an element; see section 3.11. Reference Systems.	
	n	n (number) gives a number (or other label) for an element, which necessarily unique within the document.		
		Status	Optional	
		Datatype	teidata.text	
		Note	The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in	

the specification of a standard reference system for the text

xml:lang

(language) indicates the language of the element content using a 'tag' generated according to BCP 47.

Status Optional

Datatype teidata.language

```
... The consequences of
this rapid depopulation were the loss of the last
<foreign xml:lang="rap">ariki</foreign> or chief
(Routledge 1920:205,210) and their connections to
ancestral territorial organization.
```

Note

The *xml:lang* value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify *xml:lang* at the highest appropriate level, noticing that a different default may be needed for the <teiHead-er> from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.

Only attributes with free text values (rare in these guidelines) will be in the scope of *xml:lang*.

The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see https://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.

The value used must conform with BCP 47. If the val-

The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains - x-), a <a href="starts-length: length: length:

xml:base

provides a base URI reference with which applications can resolve relative URI references into absolute URI references.

Status Optional

Datatype teidata.pointer

```
<div type="bibl">
 <head>Selections from <title level="m">The Collected Letters of Robert
                                                                               Southey. Part 1: 17
 <listBibl xml:base="https://romantic-circles.org/sites/default/files/imported/editions/sou</pre>

   </ref>
 </bibl>
 </listBibl:
```

xml:space

signals an intention about how white space should be managed by applications.

Status Optional

Datatype <u>teidata.enumerated</u>

Legal values deare: fault

	signals that the application's default white-space processing modes are acceptable
	<pre>pre- servendicates the intent that applications preserve all white space</pre>
Note	The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

5.3.20. att.global.change

att.global.change provides attributes allowing its member elements to specify one or more states or revision campaigns with which they are associated.			
Module	transcr		
Members	att.global[TEI abbr abstract addrLine address affiliation author authority availability bibl birth body byline catRef cell change closer collection country creation date dateline death del desc distinct div encodingDesc event fileDesc foreign forename geo head hi idno institution item keywords label langUsage language lb licence list listChange listEvent listOrg listPerson listPlace location metamark msDesc msIdentifier name nameLink nationality note num occupation opener org orgName origDate origPlace p pb persName person physDesc place placeName postCode postscript principal profileDesc projectDesc publicationStmt q ref repository resp respStmt revisionDesc row rs salute seriesStmt settlement sex signed sourceDesc space street surname table teiHeader term text textClass textLang title titleStmt unclear]		
Attributes	change points to one or more change elements documenting a state or revision campaign to which the element bearing this attribute and its children have been assigned by the encoder. Status Optional Datatype 1-# occurrences of teidata.pointer separated by whitespace		

5.3.21. att.global.facs

att.global.facs provides attributes used to express correspondence between an element and all or part of a facsimile image or surface. [11.1. Digital Facsimiles] Module Members att.global[TEI abbr abstract addrLine address affiliation author authority availability bibl birth body byline catRef cell change closer collection country creation date dateline death del desc distinct div encodingDesc event fileDesc foreign forename geo head hi idno insti-<u>tution item keywords label langUsage language lb licence list listChange listEvent listOrg</u> listPerson listPlace location metamark msDesc msIdentifier name nameLink nationality note <u>num occupation opener org orgName origDate origPlace p pb persName person physDe-</u> sc place placeName postCode postscript principal profileDesc projectDesc publicationStmt q ref repository resp respStmt revisionDesc row rs salute seriesStmt settlement sex signed sourceDesc space street surname table teiHeader term text textClass textLang title titleStmt unclear] Attributes facs (facsimile) points to one or more images, portions of an image, or surfaces which correspond to the current element. Status Optional **Datatype** 1-# occurrences of teidata.pointer separated by whitespace

5.3.22. att.global.rendition

att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.1.3. Rendition Indicators]

Module	tei			
Members	birth body byli del desc distin- tution item key listPerson listF num occupatio sc place placel q ref repositor	ne catRef cell chat div encodingDo words label lang lace location met n opener org orgl Name postCode p w resp respStmt re	rLine address affiliation author authority availability bible ange closer collection country creation date dateline death esc event fileDesc foreign forename geo head hi idno instiguage language lb licence list listChange listEvent listOrg amark msDesc msIdentifier name nameLink nationality note Name origDate origPlace p pb persName person physDestscript principal profileDesc projectDesc publicationStmt evisionDesc row rs salute seriesStmt settlement sex signed to table teiHeader term text textClass textLang title titleStmt	
Attributes	rend	(rendition) ir	ndicates how the element in question was rendered or pre-	
		sented in the source text.		
		Status	Optional	
		Datatype	1-# occurrences of <u>teidata.word</u> separated by whitespace	
		<1b/>To <1b/>On H	<pre>d="align(center) case(allcaps)"> The <lb></lb>Duchesse <lb></lb>of <lb></lb>Newcastle, fer <lb></lb> = "case(mixed)">New Blazing-World.</pre>	
		Note	These Guidelines make no binding recommendations for the values of the <i>rend</i> attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially useful conventions are noted from time to time at appropriate points in the Guidelines. The values of the <i>rend</i> attribute are a set of sequence-indeterminate individual tokens separated by whitespace.	
	style	contains an expression in some formal style definition language which defines the rendering or presentation used for this element in the source		
		text Status	Ontional	
		_	Optional	
		<1b/>To <1b/>	teidata.text The="text-align: center; font-variant: small-caps"> The <1b/>Duchesse <1b/>of <1b/>Newcastle, <1b/>On Her e="font-variant: normal">New Blazing-World	
		Note	Unlike the attribute values of <i>rend</i> , which uses white-space as a separator, the <i>style</i> attribute may contain whitespace. This attribute is intended for recording inline stylistic information concerning the source, not any particular output. The formal language in which values for this attribute are expressed may be specified using the <styledefdecl> element in the TEI header. If <i>style</i> and <i>rendition</i> are both present on an element, then <i>style</i> overrides or complements <i>rendition</i>. <i>style</i> should not be used in conjunction with <i>rend</i>, because the latter does not employ a formal style definition language.</styledefdecl>	
	rendition	points to a do	escription of the rendering or presentation used for this ele- ource text.	
		Status	Optional	
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space	
		<1b/>To <1b/> <hi rend<br=""> <!-- else</td--><td>uition="#ac #sc"> The <lb></lb>Duchesse <lb></lb>of <lb></lb>Newcastle, <lb></lb>On Her dition="#normal">New Blazing-World</td></hi> where> n xml:id="sc"	uition="#ac #sc"> The <lb></lb> Duchesse <lb></lb> of <lb></lb> Newcastle, <lb></lb> On Her dition="#normal">New Blazing-World	

scheme="css">font-variant: small-caps</rendition>
<rendition xml:id="normal"
scheme="css">font-variant: normal</rendition>
<rendition xml:id="ac"
scheme="css">text-align: center</rendition>

Note

The rendition attribute is used in a very similar way to the class attribute defined for XHTML but with the important distinction that its function is to describe the appearance of the source text, not necessarily to determine

how that text should be presented on screen or paper. If *rendition* is used to refer to a style definition in a formal language like CSS, it is recommended that it not be used in conjunction with *rend*. Where both *rendition* and *rend* are supplied, the latter is understood to override

or complement the former.

Each URI provided should indicate a <rendition> element defining the intended rendition in terms of some appropriate style language, as indicated by the *scheme* attribute.

5.3.23. att.global.responsibility

att.global.responsibility provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it. [1.3.1.1.4. Sources, certainty, and responsibility 3.5. Simple Editorial Changes 11.3.2.2. Hand, Responsibility, and Certainty Attributes 17.3. Spans and Interpretations 13.1.1. Linking Names and Their Referents]

13.1.1. Ellikilig Ivallies alid	Then references			
Module	tei			
Members	birth body byline del desc distinct of tution item keywood listPerson listPlace num occupation of sc place placeNat q ref repository re	catRef cell char div encodingDe ords label langue ce location met opener org orgl me postCode po esp respStmt re	rLine address affiliation author authority availability bible ange closer collection country creation date dateline death esc event fileDesc foreign forename geo head hi idno instigusage language lb licence list listChange listEvent listOrg amark msDesc msIdentifier name nameLink nationality note Name origDate origPlace p pb persName person physDestscript principal profileDesc projectDesc publicationStmt evisionDesc row rs salute seriesStmt settlement sex signed to table teiHeader term text textClass textLang title titleStmt	
Attributes	cert	(certainty) si	gnifies the degree of certainty associated with the interven- retation.	
		Status	Optional	
		Datatype	teidata.probCert	
	resp	(responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.		
		Status	Optional	
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space	
		Note	To reduce the ambiguity of a <i>resp</i> pointing directly to a person or organization, we recommend that <i>resp</i> be used to point not to an agent (<pre>sperson></pre> or <pre>sorg></pre>) but to a <pre>spStmt></pre> , <author>, <editor> or similar element which clarifies the exact role played by the agent. Pointing to multiple <pre>serspStmt></pre> s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).</editor></author>	
Example		kers	nigh">peacemakers called the children of God.	
Example		ext>> <lg< td=""><td></td></lg<>		

```
<sic>n</sic>
<corr resp="#JENS1_transcriber">u</corr>
</choice>es,</l>
<!-- ... -->

<!-- ... -->
<respStmt xml:id="JENS1_transcriber">
<resp when="2014">Transcriber</resp>
<name>Janelle Jenstad</name>
</respStmt>
```

5.3.24. att.global.source

att.global.source provides attributes used by elements to point to an external source. [1.3.1.1.4. Sources, certainty, and responsibility 3.3.3. Quotation 8.3.4. Writing]

Module	tei	
Members		Line address affiliation author authority availability bibl
	birth body byline catRef cell cha del desc distinct div encodingDe tution item keywords label langU listPerson listPlace location meta num occupation opener org orgN sc place placeName postCode po q ref repository resp respStmt re	nge closer collection country creation date dateline death sc event fileDesc foreign forename geo head hi idno insti- Jsage language lb licence list listChange listEvent listOrg mark msDesc msIdentifier name nameLink nationality note lame origDate origPlace p pb persName person physDestscript principal profileDesc projectDesc publicationStmt visionDesc row rs salute seriesStmt settlement sex signed table teiHeader term text textClass textLang title titleStmt
Attributes	source specifies the s	source from which some aspect of this element is drawn. Optional
	Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white-space
	Schematron	<pre><sch:rule context="tei:*[@source]"> <sch:let name="s- rcs" value="tokenize(normalize-space(@source),' ')"> <sch:report test="(self::tei:classRef self::tei:dataRef self::tei:elementRef self::tei:macroRef self::tei:mod- uleRef self::tei:schemaSpec) and \$srcs[2]"> When used on a schema description element (like <sch:value-of lect="name(.)" se-=""></sch:value-of>), the @source attribute should have on- ly 1 value. (This one has <sch:value-of select="count(\$s- rcs)"></sch:value-of>.) </sch:report> </sch:let></sch:rule></pre>
	Note	The <i>source</i> attribute points to an external source. When used on an element describing a schema component (<classref>, <dataref>, <elementref>, <macroref>, <moduleref>, or <schemaspec>), it identifies the source from which declarations for the components should be obtained. On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn. In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, a private scheme URI of the form tei:x.y.z, where x.y.z indicates the version number, e.g. tei:4.3.2 for TEI P5 release 4.3.2 or (as a special case) tei:current for whatever is the latest release, or a private scheme URI that is expanded to an absolute URI as documented in a <pre>prefixDef></pre>. When used on elements describing schema components, <i>source</i> should have only one value; when used on other elements multiple values are permitted.</schemaspec></moduleref></macroref></elementref></dataref></classref>
Example	<pre><!----> As Willard McCar term. <!----></pre>	ty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quot< td=""></quot<>

source="#mcc_2012":

Example	<pre><!----> <!----> <quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote> <!----> <!----> <!----> <bibl xml:id="chicago_15_ed"> <title level="m">The Chicago Manual of Style</title>, <edition>15th edition</edition>. <pubplace>Chicago</pubplace>: <publisher>University of Chicago Press</publisher> (<date>2003</date>), <bibl>cope unit="page">p.147</bibl></bibl></pre>
Example	<pre>selementRef key="p" source="tei:2.0.1"/> Include in the schema an element named available from the TEI P5 2.0.1 release.</pre>
Example	<pre></pre>

5.3.25. att.internetMedia

att.internetMedia p	rovides attributes for specifying the type of a computer resource using a standard taxonomy.
Module	tei
Members	<u>ref</u>
Attributes	mimeType (MIME media type) specifies the applicable multimedia internet mail ex tension (MIME) media type Status Optional
	Datatype 1–# occurrences of <u>teidata.word</u> separated by whitespace
Example	In this example <i>mimeType</i> is used to indicate that the URL points to a TEI XML file encoded in UTF-8. <pre></pre>
Note	target="https://raw.githubusercontent.com/TEIC/TEI/dev/P5/Source/guidelines-en.xml"/> This attribute class provides an attribute for describing a computer resource, typically avail-
Note	able over the internet, using a value taken from a standard taxonomy. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions (MIME) Media Type system. This typology of media types is defined by the Internet Engineering Task Force in RFC 2046. The list of types is maintained by the Internet Assigned Numbers Authority (IANA). The <i>mimeType</i> attribute must have a value taken from this list.

5.3.26. att.locatable

att.locatable provides attributes for referencing locations by pointing to entries in a canonical list of places. [2.3.9. The Unit Declaration 13.3.4.3. States, Traits, and Events]

Decidration 13.3.4.3. States, 1	rans, and Events		
Module	tei		
Members	event		
Attributes	where indicates one or more locations by pointing to a < <u>place></u> element or othe canonical description.		
	Status Optional		
		Datatype	1-# occurrences of <u>teidata.pointer</u> separated by white- space

5.3.27. att.naming

att.naming provides attributes common to elements which refer to named persons, places, organizations etc. [3.6.1. Referring Strings 13.3.6. Names and Nyms]

Ting burings 13:5:0. Trumes and	11/11/11/2
Module	tei

Attributes	att.canonical (@	key, @ref)	
	role	this name in ple the occup	to specify further information about the entity referenced by the form of a set of whitespace-separated values, for examplation of a person, or the status of a place.
		Status	Optional
		Datatype	1-# occurrences of teidata.enumerated separated by whitespace
	nymRef	•	the canonical name) provides a means of locating the rm (nym) of the names associated with the object named by bearing it.
		Status	Optional
		Datatype	1-# occurrences of teidata.pointer separated by white- space
		Note	The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name is associated with several distinct canonical names.

5.3.28. att.personal

att.personal (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names] Module Members forename name orgName persName placeName surname Attributes att.naming (@role, @nymRef) (att.canonical (@key, @ref)) indicates whether the name component is given in full, as an abbreviation or simply as an initial. Status Optional **Datatype** teidata.enumerated Legal values yes (yes) the name component is spelled out in ful-1.[Default] abb (abbreviated) the name component is given in an abbreviated form. init (initial letter) the name component is indicated only by one initial. (sort) specifies the sort order of the name component in relation to others sort within the name. Status Optional **Datatype** teidata.count

5.3.29. att.placement

 att.placement provides attributes for describing where on the source page or object a textual element appears. [3.5.3. Additions, Deletions, and Omissions 11.3.1.4. Additions and Deletions]

5.3.30. att.pointing

att.pointing provides a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.1.2. Language Indicators 3.7. Simple Links and Cross-References]

references. [1.3.1.1.2	Language Indicators 3./.	Simple Links and	1 Cross-References]
Module	tei		
Members	catRef licence n	ote ref term	
Attributes	targetLang		anguage of the content to be found at the destination referent, using a 'language tag' generated according to BCP 47. Optional
		Datatype	teidata.language
		Schematron	<pre><sch:rule contex-="" t="tei:*[not(self::tei:schemaSpec)][@targetLang]"></sch:rule></pre>
		<pre><ptr pre="" target="j type=" tw"<="" xml:=""></ptr></pre>	ml:id="pol-swh_aln_2.1-linkGrp"> id="pol-swh_aln_2.1.1-ptr" pol/UDHR/text.xml#pol_txt_1-head" v" ng="pl"/>

type="tuv" targetLang="sw"/> </linkGrp> In the example above, the combines pointers at parallel fragments of the Universal Declaration of Human Rights: one of them is in Polish, the other in Swahili. The value must conform to BCP 47. If the value is a pri-Note vate use code (i.e., starts with x- or contains -x-), a <\br/>language> element with a matching value for its *ident* attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their IETFInternet Engineering Task Force definitions. target specifies the destination of the reference by supplying one or more URI References Status Optional **Datatype** 1-# occurrences of teidata.pointer separated by white-One or more syntactically valid URI references, separat-Note ed by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium. evaluate (evaluate) specifies the intended meaning when the target of a pointer is itself a pointer. Status Optional **Datatype** teidata.enumerated Legal values all

<ptr xml:id="pol-swh_aln_2.1.2-ptr"
target="swh/UDHR/text.xml#swh_txt_1-head"</pre>

if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the

if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.

target of this pointer.

none

no further evaluation of targets is carried out beyond that needed to find the element specified in

the pointer's target.

Note

are:

If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.

5.3.31. att.ranging

att.ranging provides attributes for describing numerical ranges.			
Module	tei		
Members	att.dimensions[birth date death of	lel origDate space unclear] num
Attributes	atLeast	Status Optional Datatype teidata.numeric	
	atMost	Status	mum estimated value for the approximate measurement. Optional

		Datatype	teidata.numeric
	min		easurement summarizes more than one observation or a es the minimum value observed.
		Status	Optional
		Datatype	teidata.numeric
	max		easurement summarizes more than one observation or a es the maximum value observed.
		Status	Optional
		Datatype	teidata.numeric
	confidence	a value falls	degree of statistical confidence (between zero and one) that within the range specified by <i>min</i> and <i>max</i> , or the proportion values that fall within that range.
		Status	Optional
		Datatype	teidata.probability
Example	<pre><gap one<="" pre="" reason=" extent="></gap></pre>	illegible" or two letters"	tion by mail from <del rend="overstrike"> atLeast="1" atMost="2" unit="chars"/> aphic office, New York.
Example	Europe since commodity="cu		

5.3.32. att.sortable

Module	tei		
Members	bibl event idn place term	o item list listCha	nge listEvent listOrg listPerson listPlace msDesc org person
Attributes	sortKey	supplies the contains it.	sort key for this element in an index, list or group which
		Status	Optional
		Datatype	teidata.word
		ha-Koher <term so<="" td=""><td>other principal backer, Josiah n <index indexname="NAMES"> ortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</index></td></term> b. Azarya, son of one of the last gaons of Sura was David's ow	other principal backer, Josiah n <index indexname="NAMES"> ortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</index>
		Note	The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produced the desired order; specifics of sort key construction are application-dependent Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under 'fourh', and McCoy may be alphabetized under 'maccoy', while A1, A4, and A5 may all appear in numeric order 'alphabetized' between 'a' and 'AA'. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

5.3.33. att.spanning

att.spanning provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [11.3.1.4. Additions and Deletions 1.3.1. Attribute Classes]

Module tei

Members	<u>lb</u> metamark pb			
Attributes	^	o indicates the end of a span initiated by the element bearing this attribute. Status Optional		
		atatype	teidata.pointer	
	So	chematron	The @spanTo attribute must point to an element following the current element <sch:rule context="tei:*[@spanTo]"> <sch:assert test="id(substring(@spanTo,2)) and following::*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (<sch:value-of select="@spanTo"></sch:value-of>) must follow the current element <sch:name></sch:name> </sch:assert> </sch:rule>	
Note	ing element to the end any). If no value is su with the pointing elen	The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the <i>spanTo</i> attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.		

5.3.34. att.tableDecoration

5.5.54. un.moreD				
att.tableDecoration p tated Music]	provides attributes used t	to decorate rows of	or cells of a table. [14. Tables, Formulæ, Graphics, and No-	
Module	figures			
Members	<u>cell</u> <u>row</u>			
Attributes	role	(role) indicat this row.	(role) indicates the kind of information held in this cell or in each cell of this row.	
		Status	Optional	
		Datatype	teidata.enumerated	
		Suggested values in-	la-bel labelling or descriptive information only.	
		clude:	da-	
			ta data values.[Default]	
		Note	When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the <i>role</i> attribute of the parent < <u>row</u> > element.	
	rows	(rows) indicates the number of rows occupied by this cell or row.		
		Status	Optional	
		Datatype	teidata.count	
		Default	1	
		Note	A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.	
	cols	(columns) in	(columns) indicates the number of columns occupied by this cell or row.	
		Status	Optional	
		Datatype	teidata.count	
		Default	1	
		Note	A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.	

5.3.35. att.transcriptional

	rovides attributes specific to r similar sources. [11.3.1.4.		ding authorial or scribal intervention in a text when tran- Deletions]
Module	tei		
Members	<u>del</u>		
Attributes	att.editLike (@evi	dence, @instar	nt) att.written (@hand)
	status	tion, strikeout of an addition present.	effect of the intervention, for example in the case of a deless which include too much or too little text, or in the case, an insertion which duplicates some of the text already
		Status	Optional
		Datatype	teidata.enumerated
		Sample values include:	du- pli- all of the text indicated as an addition duplicates cate some text that is in the original, whether the du- plication is word-for-word or less exact.
			du- pli- part of the text indicated as an addition duplicates cate-pane text that is in the original tial
			ex- cessSome text at the beginning of the deletion is tart marked as deleted even though it clearly should not be deleted.
			ex- cessEndhe text at the end of the deletion is marked as deleted even though it clearly should not be deleted.
			 short- S- some text at the beginning of the deletion is not tart marked as deleted even though it clearly should be.
			short-End some text at the end of the deletion is not marked as deleted even though it clearly should be.
			tial some text in the deletion is not marked as deleted even though it clearly should be.
			un-re- the deletion is not faulty.[Default]mark-able
		Note	Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.
			Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is th linguistic acceptability of the text with and without the letters or words in question.
	cause	documents the	e presumed cause for the intervention.
		Status	Optional
		Datatype	teidata.enumerated

seq	(sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.	
	Status	Optional
	Datatype	teidata.count

5.3.36. att.typed

att.typed provides attributes that can be used to classify or subclassify elements in any way. [1.3.1. Attribute Classes 17.1.1. Words and Above 3.6.1. Referring Strings 3.7. Declaration	<pre>macro.phraseSeq = (text model.gLike model.attributable model.phrase model.global)*</pre>	

5.4.4. macro.phraseSeq.limited

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]		
Module	tei	
Used by	authority collection institution language principal repository resp	
Content model	<pre><content> <alternate maxoccurs="unbounded" minoccurs="0"> <textnode></textnode> <classref key="model.limitedPhrase"></classref> <classref key="model.global"></classref> </alternate> </content></pre>	
Declaration	macro.phraseSeq.limited = (text model.limitedPhrase model.global)*	

5.4.5. macro.specialPara

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

*	
Module	tei
Used by	cell change item licence metamark note occupation q textLang
Content model	<pre><content> <alternate maxoccurs="unbounded" minoccurs="0"> <textnode></textnode> <classref key="model.gLike"></classref> <classref key="model.phrase"></classref> <classref key="model.inter"></classref> <classref key="model.inter"></classref> <classref key="model.divPart"></classref> <classref key="model.divPart"></classref> <classref key="model.global"></classref> </alternate></content></pre>
Declaration	<pre>macro.specialPara = (text model.gLike model.phrase model.inter model.divPart model.global)*</pre>

5.5. Datatypes

5.5.1. teidata.certainty

teidata.certainty defines the range of attribute values expressing a degree of certainty.		
Module	tei	
Used by	teidata.probCert	
Content model	<pre><content> <valitst type="closed"></valitst></content></pre>	
Declaration	teidata.certainty = "high" "medium" "low" "unknown"	
Note	Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.	

5.5.2. teidata.count

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.		
Module	tei	
Used by	Element: • table/@rows • table/@cols	
Content model	<pre><content> <dataref name="nonNegativeInteger"></dataref> </content></pre>	
Declaration	teidata.count = xsd:nonNegativeInteger	
Note	Any positive integer value or zero is permitted	

5.5.3. teidata.duration.iso

teidata.duration.iso defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats		
Module	tei	
Used by		
Content model	<content> <dataref name="token" restriction="[0-9.,DHMPRSTWYZ/:+\-]+"></dataref> </content>	
Declaration	teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }	
Example	<time dur-iso="PT0,75H">three-quarters of an hour</time>	
Example	<date dur-iso="P1,5D">a day and a half</date>	
Example	<date dur-iso="P14D">a fortnight</date>	
Example	<time dur-iso="PT0.02S">20 ms</time>	
Note	A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first 'time' number-letter pair. For complete details, see ISO 8601 Data elements and interchange formats — Information interchange — Representation of dates and times.	

5.5.4. teidata.duration.w3c

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.	
Module	tei
Used by	
Content model	<pre><content> <dataref name="duration"></dataref> </content></pre>
Declaration	teidata.duration.w3c = xsd:duration
Example	<time dur="PT45M">forty-five minutes</time>
Example	<pre><date dur="P1DT12H">a day and a half</date></pre>
Example	<date dur="P7D">a week</date>

Example	<time dur="PT0.02S">20 ms</time>
Note	A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first 'time' number-letter pair. For complete details, see the W3C specification.

5.5.5. teidata.enumerated

teidata.enumerated de possibilities.	efines the range of attribute values expressed as a single XML name taken from a list of documented
Module	tei
Used by	teidata.gender teidata.sexElement:
	• abbr/@type
	affiliation/@type
	• <u>availability</u> /@status
	• <u>birth</u> /@type
	• <u>death</u> /@type
	• desc/@type
	distinct/@type
	• <u>div</u> /@type
	• <u>idno</u> /@type
	• <u>list</u> /@type
	• <u>nationality</u> /@type
	• <u>num</u> /@type
	occupation/@type
	• <u>org</u> /@role
	• person/@role
	• person/@age
	• q/@type
	• <u>rs</u> /@type
	• space/@dim
	• <u>title</u> /@type
	• <u>title</u> /@level
	• <u>unclear</u> /@reason
	• unclear/@agent
Content model	<pre><content> <dataref key="teidata.word"></dataref> </content></pre>
Declaration	teidata.enumerated = teidata.word
Note	Attributes using this datatype must contain a single 'word' which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <vallist> element.</vallist>

5.5.6. teidata.gender

teidata.gender defines the range of attribute values used to represent the gender of a person, persona, or character.

Module	tei
Used by	Element:
	• person/@gender
Content model	<pre><content> <dataref key="teidata.enumerated"></dataref> </content></pre>
Declaration	teidata.gender = teidata.enumerated
Note	Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard. Values for this datatype should not be used to encode morphological gender (cf. <gen>, msd as defined in att.linguistic, and 9.3.1. Information on Written and Spoken Forms).</gen>

5.5.7. teidata.language

teidata.language defining system. [6.1. Langu	es the range of attribute values used to identify a particular combination of human language and writage Identification]
Module	tei
Used by	Element:
	• <u>foreign</u> /@xml:lang
	• <u>language</u> /@ident
	• <u>textLang</u> /@mainLang
	• <u>textLang</u> /@otherLangs
Content model	<pre><content> <alternate> <dataref name="language"></dataref> <vallist> <vallitem ident=""></vallitem> </vallist> </alternate> </content></pre>
Declaration	teidata.language = xsd:language ("")
Note	The values for this attribute are language 'tags' as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice. A 'language tag', per BCP 47, is assembled from a sequence of components or <i>subtags</i> separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.
	The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at http://www.iana.org/assignments/language-subtag-registry. It is recommended that this code be written in lower case. script The ISO 15924 code for the script. These codes consist of 4 letters, and it is
	recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at http://unicode.org/iso15924/iso15924-codes.html. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.
	Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at https://www.iso.org/obp/ui/#search/code/. The latter consist

of 3 digits; the list of codes can be found at http://unstats.un.org/unsd/meth-ods/m49/m49.htm.

variant

An IANA-registered variation. These codes 'are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags'.

extension

An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

private use

An extension that uses the initial subtag of the single letter x (i.e., starts with x–) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding \leq language \geq element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been 'grandfathered' from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with x-, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags, the language in question must be documented in a corresponding subtags.

Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

5.5.8. teidata.name

teidata.name defines the range of attribute values expressed as an XML Name.	
Module	tei
Used by	
Content model	<content> <dataref name="Name"></dataref> </content>
Declaration	teidata.name = xsd:Name
Note	Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see https://www.w3.org/TR/REC-xml/#dt-name): for example they cannot include whitespace or begin with digits.

5.5.9. teidata.numeric

teidata.numeric defines the range of attribute values used for numeric values.	
Module	tei

Used by	Element:
	• <u>num</u> /@value
Content model	<pre><content> <alternate> <dataref name="double"></dataref> <dataref name="token" restriction="(\-?[\d]+/\-?[\d]+)"></dataref> <dataref name="decimal"></dataref> </alternate> </content></pre>
Declaration	teidata.numeric = xsd:double token { pattern = "(\-?[\d]+/\-?[\d]+)" } xsd:decimal
Note	Any numeric value, represented as a decimal number, in floating point format, or as a ratio. To represent a floating point number, expressed in scientific notation, 'E notation', a variant of 'exponential notation', may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3. A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

$5.5.10.\ teidata. output Measurement$

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.	
Module	tei
Used by	
Content model	<pre><content> <dataref name="token" restriction="[\-+]?\d+(\.\d+)?(% cm mm in pt pc px em ex ch rem vw vh vmin vmax)"></dataref> </content></pre>
Declaration	<pre>teidata.outputMeasurement = token { pattern = "[\-+]?\d+(\.\d+)?(% cm mm in pt pc px em ex ch rem vw vh vmin vmax)" }</pre>
Example	<pre><figure></figure></pre>
Note	These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

5.5.11. teidata.pattern

teidata.pattern defines attribute values which are expressed as a regular expression.	
Module	tei
Used by	
Content model	<pre><content> <dataref name="token"></dataref> </content></pre>
Declaration	teidata.pattern = token

Note	A regular expression, often called a <i>pattern</i> , is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings $Handel$, $H\ddot{a}$ and $Haendel$ can be described by the pattern $H(\ddot{a} ae?) ndel$ (or alternatively, it is said that the pattern $H(\ddot{a} ae?) ndel$ $matches$ each of the three strings)
	Wikipedia This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

5.5.12. teidata.point

teidata.point defines the data type used to express a point in cartesian space.	
Module	tei
Used by	
Content model	<pre><content> <dataref name="token" restriction="(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)"></dataref> </content></pre>
Declaration	teidata.point = token { pattern = "(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)" }
Example	<facsimile> <surface lrx="400" lry="280" ulx="0" uly="0"> <zone points="220,100 300,210 170,250 123,234"> <graphic url="handwriting.png"></graphic> </zone> </surface></facsimile>
Note	A point is defined by two numeric values, which should be expressed as decimal numbers. Neither number can end in a decimal point. E.g., both 0.0,84.2 and 0,84 are allowed, but 0.,84. is not.

5.5.13. teidata.pointer

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere

er resource, either withir	er resource, either within the current document or elsewhere.	
Module	tei	
Used by	Element: • catRef/@target • catRef/@scheme • change/@target • keywords/@scheme • metamark/@target • occupation/@scheme • occupation/@code • pb/@facs • rs/@ref • space/@resp	
Content model	<content> <dataref name="anyURI" restriction="\S+"></dataref> </content>	
Declaration	teidata.pointer = xsd:anyURI { pattern = "\S+" }	
Note	The range of syntactically valid values is defined by RFC 3986 Uniform Resource Identifier (URI): Generic Syntax. Note that the values themselves are encoded using RFC 3987 Internationalized Resource Identifiers (IRIs) mapping to URIs. For example, https://secure.wikimedia.org/wikipedia/en/wiki/% is encoded as https://secure.wikimedia.org/wikipedia/en/wiki/%25 while http://	

```
-mr---nx.mirbg4--n###.#############.###/ is encoded as http://ckbbajlc6dj7bxne2c.xn--wgbhlc/
```

5.5.14. teidata.probCert

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.	
Module	tei
Used by	
Content model	<pre><content> <alternate> <dataref key="teidata.probability"></dataref> <dataref key="teidata.certainty"></dataref> </alternate> </content></pre>
Declaration	teidata.probCert = teidata.probability teidata.certainty

5.5.15. teidata.probability

eidata.probability defines the range of attribute values expressing a probability.	
Module	tei
Used by	teidata.probCert
Content model	<pre><content> <dataref name="double"></dataref> </content></pre>
Declaration	teidata.probability = xsd:double
Note	Probability is expressed as a real number between 0 and 1; 0 representing <i>certainly false</i> and 1 representing <i>certainly true</i> .

5.5.16. teidata.replacement

teidata.replacement defines attribute values which contain a replacement template.	
Module	tei
Used by	
Content model	<content> <textnode></textnode> </content>
Declaration	teidata.replacement = text

5.5.17. teidata.sex

teidata.sex defines the range of attribute values used to identify the sex of an organism.	
Module	tei
Used by	Element: • person/@sex • sex/@value
Content model	<pre><content> <dataref key="teidata.enumerated"></dataref> </content></pre>
Declaration	teidata.sex = teidata.enumerated
Note	Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard.

5.5.18. teidata.temporal.iso

teidata.temporal.iso defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the international standard *Data elements and interchange formats – Information interchange – Representation of dates and times*.

0 1		
Module	tei	
Used by		
Content model	<pre><content> <alternate> <dataref name="date"></dataref> <dataref name="gYear"></dataref> <dataref name="gMonth"></dataref> <dataref name="gMonth"></dataref> <dataref name="gWarMonth"></dataref> <dataref name="gWonthDay"></dataref> <dataref name="gMonthDay"></dataref> <dataref name="time"></dataref> <dataref name="time"></dataref> <dataref name="time"></dataref> <dataref name="time"></dataref> <dataref name="token" restriction="[0-9.,DHMPRSTWYZ/:+\-]+"></dataref> </alternate> </content></pre>	
Declaration	<pre>teidata.temporal.iso = xsd:date xsd:gYear xsd:gMonth xsd:gDay xsd:gPearMonth xsd:gMonthDay xsd:time xsd:dateTime token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }</pre>	
Note	If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used. For all representations for which ISO 8601:2004 describes both a <i>basic</i> and an <i>extended</i> format, these Guidelines recommend use of the extended format.	

5.5.19. teidata.temporal.w3c

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.	
Module	tei
Used by	
Content model	<pre><content> <alternate> <dataref name="date"></dataref></alternate></content></pre>
Declaration	teidata.temporal.w3c =
Note	If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

5.5.20. teidata.text

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.	
Module	tei
Used by	Element: • distinct/@time • distinct/@space • distinct/@social • metamark/@style • pb/@n
Content model	<content></content>
Declaration	teidata.text = string
Note	Attributes using this datatype must contain a single 'token' in which whitespace and other punctuation characters are permitted.

5.5.21. teidata.truthValue

teidata.truthValue defines the range of attribute values used to express a truth value.	
Module	tei
Used by	Element:
	• <u>listChange</u> /@ordered
Content model	<content></content>
Declaration	teidata.truthValue = xsd:boolean
Note	The possible values of this datatype are 1 or true, or 0 or false. This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: teidata.xTruthValue.

5.5.22. teidata.version

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.	
Module	tei
Used by	Element: • TEI/@version
Content model	<pre><content> <dataref name="token" restriction="[\d]+(\.[\d]+){0,2}"></dataref> </content></pre>
Declaration	teidata.version = token { pattern = "[\d]+(\.[\d]+){0,2}" }
Note	The value of this attribute follows the pattern specified by the Unicode consortium for its version number (http://unicode.org/versions/). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

5.5.23. teidata.versionNumber

teidata.versionNumber defines the range of attribute values used for version numbers.

Module	tei
Used by	
Content model	<pre><content> <dataref name="token" restriction="[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}"></dataref> </content></pre>
Declaration	teidata.versionNumber = token { pattern = "[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}" }

5.5.24. teidata.word

teidata.word defines the range of attribute values expressed as a single word or token.	
Module	tei
Used by	teidata.enumeratedElement: • del/@rend • metamark/@function
Content model	<pre><content> <dataref name="token" restriction="[^\p{C}\p{Z}]+"></dataref> </content></pre>
Declaration	teidata.word = token { pattern = "[$\p{C}\p{z}$]+" }
Note	Attributes using this datatype must contain a single 'word' which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

5.5.25. teidata.xTruthValue

teidata.xTruthValue (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.	
Module	tei
Used by	
Content model	<content> <alternate> <dataref name="boolean"></dataref> <vallist> <valitem ident="unknown"></valitem> <valitem ident="inapplicable"></valitem> </vallist> </alternate></content>
Declaration	teidata.xTruthValue = xsd:boolean ("unknown" "inapplicable")
Note	In cases where where uncertainty is inappropriate, use the datatype teidata.TruthValue.

5.5.26. teidata.xpath

teidata.xpath defines attribute values which contain an XPath expression.	
Module	tei
Used by	
Content model	<content> <textnode></textnode> </content>
Declaration	teidata.xpath = text
Note	Any XPath expression using the syntax defined in 6.2

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.
